PETITION FOR *INTER PARTES* REVIEW
UNDER 37 C.F.R. § 42.100

On behalf of SOLiD, Inc. (“SOLiD” or “Petitioner”) and in accordance with 35 U.S.C. § 311 and 37 C.F.R. § 42.100, *inter partes* review (“IPR”) is respectfully requested for claims 1-40 of U.S. Patent No. 8,577,286 (“the ’286 patent”) (Ex. 1003).

The undersigned representative of Petitioner authorizes the Office to charge the Petition and Post-Institution Fees, and any additional fees, to Deposit Account 503013, ref: 428880-605001.

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

I. Introduction

U.S. Patent No. 8,577,286 (the '286 patent) describes a digital antenna system that enables extension of radio frequency (RF) analog signals from base stations to areas (*e.g.*, inside of buildings) where access to such signals is inhibited. The '286 patent systems include a digital host unit that communicates with a base station, and a plurality of remote units distributed within the hard to reach area. On the forward path, the '286 patent digitizes analog signals received from the base station and transmits those digital signals to the remote units. The remote units then convert the digital signals back to analog and forward them to nearby wireless devices via their antennas. On the reverse path, the remote units sample and digitize analog RF signals received at the antennas and forward the digital data to the host unit. The host unit sums digital sample data received from multiple remote units and uses the summed data values to generate analog signals that are forwarded to the base station.

The '286 patent was allowed in part based on claim features describing the digital host unit performing the digital summing operation on digitized radio frequency signals received at the host unit. *See*, Ex. 1003, claim 1. While the Examiner found the claims of the '286 patent to be patentable, the Examiner did not have the benefit of the Oh reference (Ex. 1007) cited herein. The Examiner's failure to find the Oh reference is understandable because Oh is a publication of a Korean patent application filed in April 1999 that was published in Korean in August 1999.

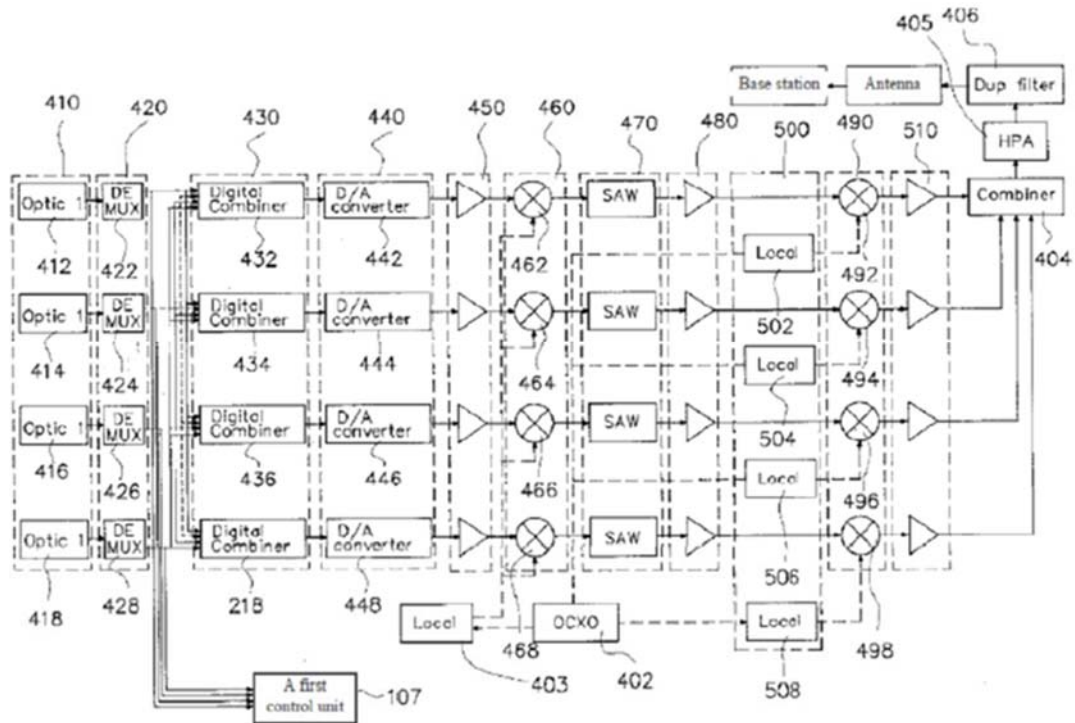

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

Oh clearly discloses the '286 patent's claimed systems and methods. Oh discloses a Digital Optic Repeater illustrated in Fig. 1 that helps extend RF signals to what it calls hard to reach "radio wave shadow areas" (Ex. 1007, Abstract).

And Oh discloses the host-based digital summing operation, where digital data is received at master unit 20 at 412, 414, 416, and 418 from multiple remote slave units 30 and is routed to digital combiners 432, 434, 436, 438 on which an analog RF signal is created for transmission to the base station. *See*, Ex. 1007, 5:14-17 ("Four intermediate frequency signals in the same frequency band outputted from each demultiplexer are transmitted to one digital combiner. After creating 14-bit intermediate frequency signals by combining four 12-bit intermediate frequency signals in the same frequency band,...")

FIG. 5

Had the Examiner had access to the Oh reference during prosecution, the '286 patent would not have issued. Because the challenged are unpatentable as described herein, institution of trial for *Inter Partes* Review is requested to consider cancellation of the challenged claims. Ex. 1005, ¶¶31-58, 70-75.

II. Grounds For Standing Pursuant To 37 C.F.R. § 42.104(a)

The '286 patent is expired but remains in the time period during which it may be asserted under 35 U.S.C. § 286. Petitioner certifies the '286 patent is available for IPR and Petitioner is not barred or estopped from requesting IPR challenging the patent claims on the grounds identified herein.

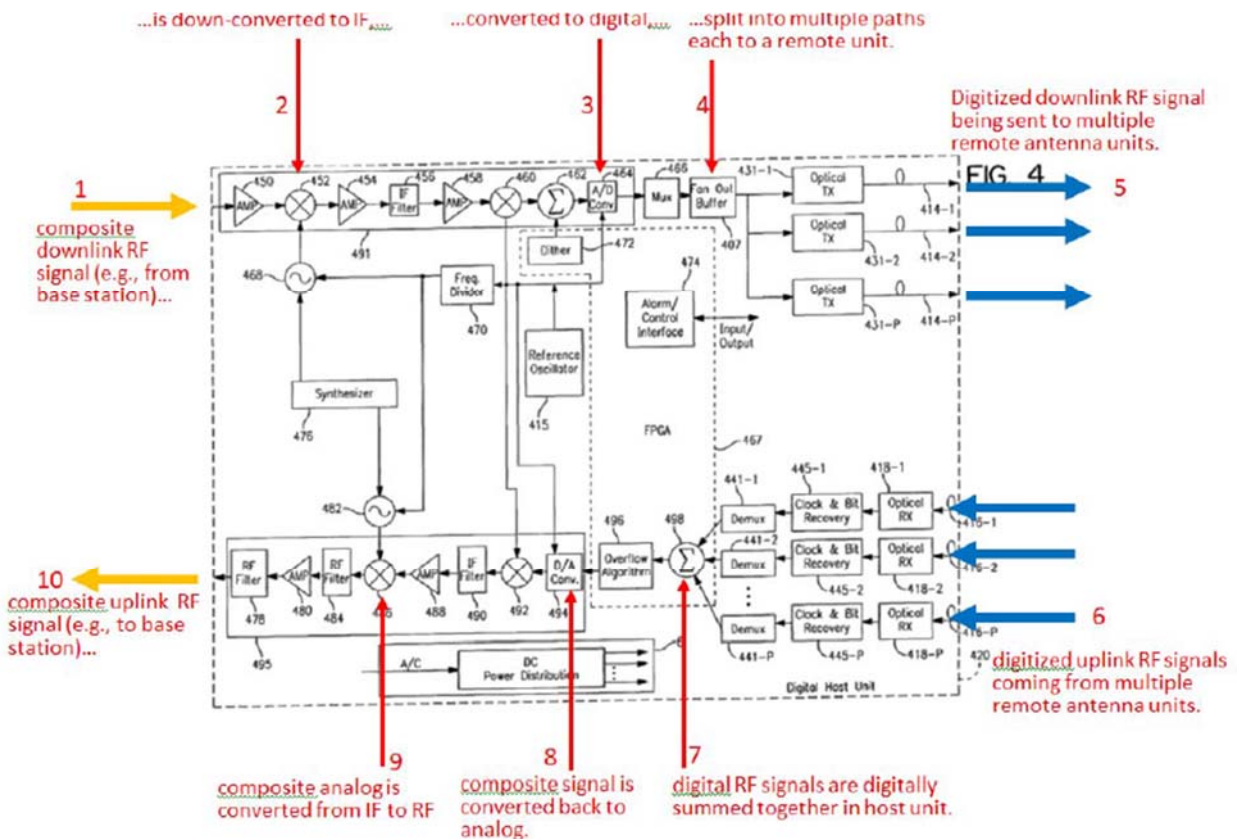

III. Background Information For The '286 Patent

A. Overview Of The '286 Patent

The '286 patent is directed to a digital distributed antenna system illustrated in Fig. 1 having a host unit and multiple distributed remote antenna units.

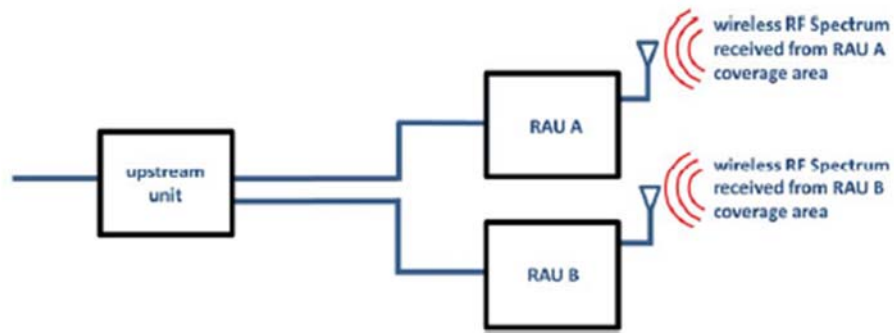

Annotated Fig. 4 of the '286 patent below illustrates a host unit that provides digitization of an RF signal received from a base station (top left) for distribution to multiple digital remote units (top right). Annotated Fig. 4 further illustrates creation of an uplink RF signal for transmission to the base station (bottom left) based on digital samples received from multiple digital remote units (bottom right).

In the downlink direction, the host unit down-converts a composite downlink RF signal, takes a sequence of digitized samples, and delivers a sequence of digitized samples over a fiber optic cable to each of several remote units. Ex. 1003, 7:12-26. At each digital remote unit, the arriving stream of digital samples are converted back into the analog signal from which they are derived and then delivered to an antenna for transmission. *Id.*, 9:14-29.

In the uplink direction, each digital remote unit receives the wireless RF spectrum from its coverage area and converts this to a sequence of digital samples that are sent over a fiber optic cable to the host unit.

Ex. 1003, 9:42-47 (drawing from Ex. 1008, ¶173, Patent Owner’s background description of this patent family showing remote antenna units (RAU) relaying signals from wireless devices to an upstream unit, *e.g.*, a host unit). The upstream unit receives the sequence of samples from the respective remote units and digitally sums the corresponding digital samples from the respective remote units by summing corresponding digital values of the recorded samples.

Ex. 1003, 7:62-8:16; Ex. 1008, ¶177. The summed digital samples are then converted into an analog signal and converted to an RF signal for delivery to the base station.

Id.; Ex. 1005, ¶¶59-63.

B. Overview Of The Prosecution History

The '286 patent issued after a single Office Action having only a double patenting rejection. The '286 patent was allowed after filing of a terminal disclaimer.

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

Ex. 1017, 117, 15. Oh was not considered by the Examiner during prosecution of the '286 patent.

C. Level Of Skill In The Art

A person of ordinary skill in the art ("POSITA") as of July 2000 (the earliest patent filing date to which the '286 patent could claim priority) would have possessed at least a bachelor's degree in electrical engineering with at least two years of industry experience with data communications system (or equivalent degree or experience). Ex. 1005, ¶¶3-19, 28-30. A person could also have qualified as a POSITA with some combination of (1) more formal education (such as a master's of science degree) and less technical experience, or (2) less formal education and more technical or professional experience. *Id.*

IV. Identification Of Challenge Pursuant To 37 C.F.R. § 42.104(b)

A. 37 C.F.R. § 42.104(b)(1): Claims For Which IPR Is Requested

IPR is requested for claims 1-40 of the '286 patent.

B. 37 C.F.R. § 42.104(b)(2): The Prior Art And Specific Grounds On Which The Challenge To The Claims Is Based

IPR is requested in view of the following references:

- Korean Laid-Open Disclosure No. KR1999-0064537 to Yong Hoon Oh ("Oh") (Ex. 1007). Oh is prior art to the '286 patent at least under 35 U.S.C. § 102(a).
- U.S. Patent No. 6,496,546 to Stephen Alan Allpress ("Allpress") (Ex. 1021). Allpress is prior art to the '286 patent under at least 35 U.S.C. § 102(e).

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

- U.S. Patent No. 5,969,837 to Allan Farber (“Farber”) (Ex. 1022). Farber is prior art to the ’286 patent under at least §§ 102(a), (b), and (e).

The specific statutory grounds on which the challenge to the claims is based and prior art relied upon for each ground are as follows:

Ground 1a: Claims 1-4, 7-17, 19-34, and 37-39 are unpatentable under 35 U.S.C. § 103 over Oh; and

Ground 1b: Claims 5-6, 18, 35, 36, and 40 are unpatentable under 35 U.S.C. § 103 over Oh in view of Allpress. Ex. 1005, ¶¶23-27.

C. 37 C.F.R. § 42.104(b)(3): Claim Construction

The Board gives claims their ordinary and customary meaning, or “the meaning that the term would have to a [POSITA] at the time of the invention.” *Phillips v. AWH Corp.*, 415 F.3d 1303, 1312-13 (Fed. Cir. 2005) (en banc). Petitioner proposes no claim terms for construction at this time.

D. 37 C.F.R. § 42.104(b)(4): How The Construed Claims Are Unpatentable

An explanation of how claims 1-40 are unpatentable, including where each claim feature is found in the prior art and the motivation to combine the prior art, is set forth below in Section V.

E. 37 C.F.R. § 42.104(b)(5): Supporting Evidence

An Appendix of Exhibits supporting this petition is attached. Exhibit 1005 is a supporting Declaration of Dr. R. Jacob Baker.

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

V. There Is A Reasonable Likelihood Claims 1-40 Of The '286 Patent Are Unpatentable

A. Brief Overview Of The Prior Art

1. Overview Of Oh

Oh is a publication of a Korean patent application filed by Yong Hoon Oh on April 3, 1999. Oh was published on August 5, 1999.

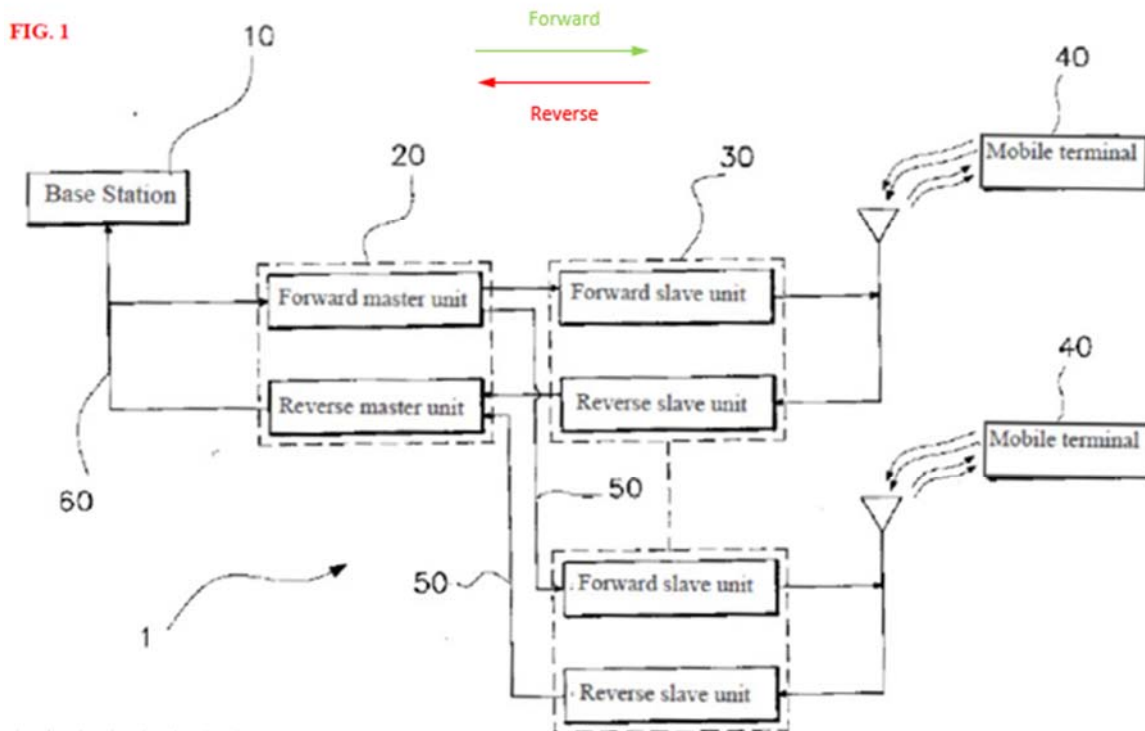

Oh discloses an optic repeater system that is installed to facilitate communications to and from “radio wave shadow area” where base station signals are unable to reach. Ex. 1007, 2:4-7. When a “base station is far away” or when the mobile terminal is “in the radio wave shadow area, the base station cannot perform streamlined transmission/reception to/from the mobile terminals.” *Id.*, 2:11-13.

Optic repeater systems were used prior to Oh in an attempt to provide wireless access to mobile terminals in the radio wave shadow area. *Id.*, 2:16-19. In those historic systems, transmissions between the primary unit and the remote units across an optic line were analog. *Id.*, 2:20-22. But because “the RF signals transmitted/received to/from said first optic repeater and a second optic repeater [were] analog signals, the strength of the signals is greatly decreased during transmission through the optical line.” *Id.*, 2:28-30. This analog signal attenuation required implementation of signal amplifiers in prior systems, which exacerbated signal-to-noise ratio issues. *Id.*, 2:30-33.

To address the analog signal attenuation issue, Oh “provide[s] a digital optic

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

repeater that can maximize the efficiency of signal transmission in such a way that the optic repeater converts the intermediate frequency signals, analog signals, to the digital signals and transmits/receives them through the optical line.” *Id.*, 2:36-39. An Oh optic repeater system includes a first optic repeater (master unit 20) that is in communication with the base station 10 and second optic repeaters (slave units 30) that are distributed within the radio wave shadow area. *Id.*, Abstract, 2:19-20.

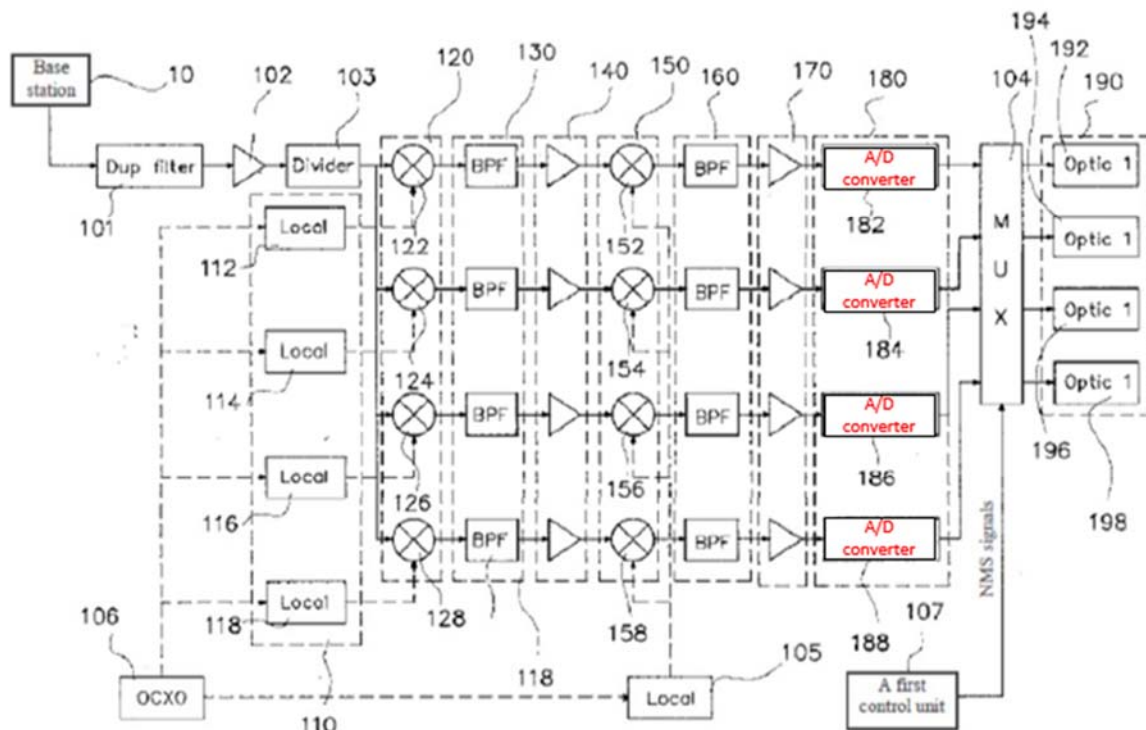

On the forward path (left-to-right in Fig. 1), RF signals are received by the forward portion of master unit 20 from the base station 10 and are processed by the forward master unit 100. *Id.*, 2:72-73. The forward master unit 100 “converts RF signals, analog signals, transmitted from the base station 10 to the intermediate frequency signals; converts them to digital signals; and transmits them to the slave

unit 30 through the optic line 50.” *Id.*, 3:5-6. The forward portion of the slave units 30 (e.g., forward slave unit 200) “converts digital signals to the intermediate frequency signals, analog signals; converts the intermediate frequency signals to RF signals; and transmits them to the mobile terminals 40. *Id.*, 3:1-4.

On the reverse path (right-to-left in Fig. 1), the reverse portion of slave unit 30 (e.g., reverse slave unit 300) converts analog RF signals received from the mobile terminals 40 to digital signals and transmits them to master unit 20 through the optic line 50. *Id.*, 4:23-25. The reverse portion of master unit 20 (e.g., reverse master unit 400) “converts the digital signals transmitted from the slave unit 30 through the optic line 50 to the intermediate frequency signals, analog signals, converts them to the RF signals, and transmits them to the base station 10.” *Id.*, 4:62-64.

FIG. 2

Labels for 182, 184, 186, 188 fixed here. See Oh, 3:40 (“four A/D converters 182, 184, 186, and 188”)

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

Fig. 2 provides example detail of the forward portion of Oh's master unit 20. The forward master unit receives RF signals from the base station 10 through a bi-directional filter 101. A divider 103 divides the RF signals into its component frequency bands (*i.e.*, the component frequency bands that make up the RF signal received from the base station 10), where each of those component band signals is processed in parallel through first mixer unit 120, band pass filter (BPF) 130, amplifier 140, second mixer unit 150, second BPF 160, and second amplifier 170 collectively to transition the signals from their band frequencies to baseband frequency close to DC. *Id.*, 3:6-14. Analog to Digital (A/D) converters 182, 184, 186, 188 sample the baseband signals to convert them to digital representations of the analog component frequency band signals. *Id.*, 3:14-16. Multiplexer 104 multiplexes the four 12-bit digital sample values with 4-bit network management system (NMS) control data from control unit 107 and applies that 52-bit (*i.e.*, the 4-12-bit words plus the 4-bit NMS control information) serial data stream to each of a plurality of optic converters 192, 194, 196, 198 for transmission across optic lines 50 to destination slave units. *Id.*, 3:38-44.

FIG. 3

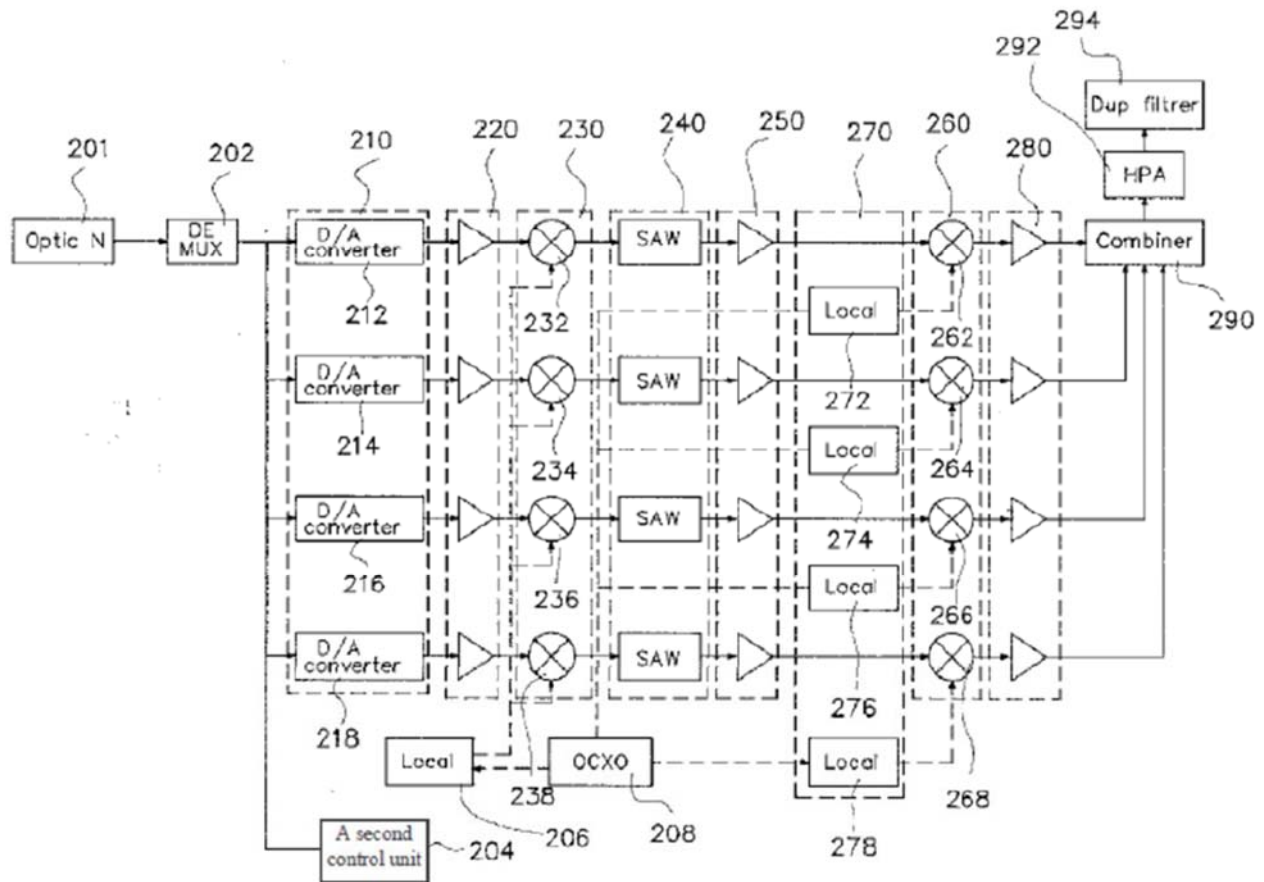

Fig. 3 provides example detail of the forward portion of one of Oh's slave units 30. The 52-bit digital signal transmitted on one of the optic lines 50 is received at a second optic converter unit 201. The 4 bits of control data are provided to control unit 204. Each of the 12-bit sample signals is routed to a respective digital to analog (D/A) converter 212, 214, 216, 218 at the start of respective paths for recreating the RF signal received from the base station *Id.*, 3:62-25. Each D/A converter converts its 12-bit digital signals to intermediate frequency signals, which are amplified at 220, mixed with a step up frequency at 230, amplified again at 250, mixed with a respective

frequency at 260 to recreate the analog band frequency signals, and amplified again at 280. *Id.*, 3:50-59. “[C]ombiner 290 [] combines the RF signals of four different frequency bands [*i.e.*, analog combining (Ex. 1005, ¶58)]... and transmits them to the mobile terminals 40 through a second power amplifier 292 and a second bi-directional filter 294.” *Id.*, 3:59-61.

FIG. 4

Labels for 382, 384, 386, 388 fixed here. See Oh, 4:53-54 (“four A/D converters 382, 384, 386, 388”)

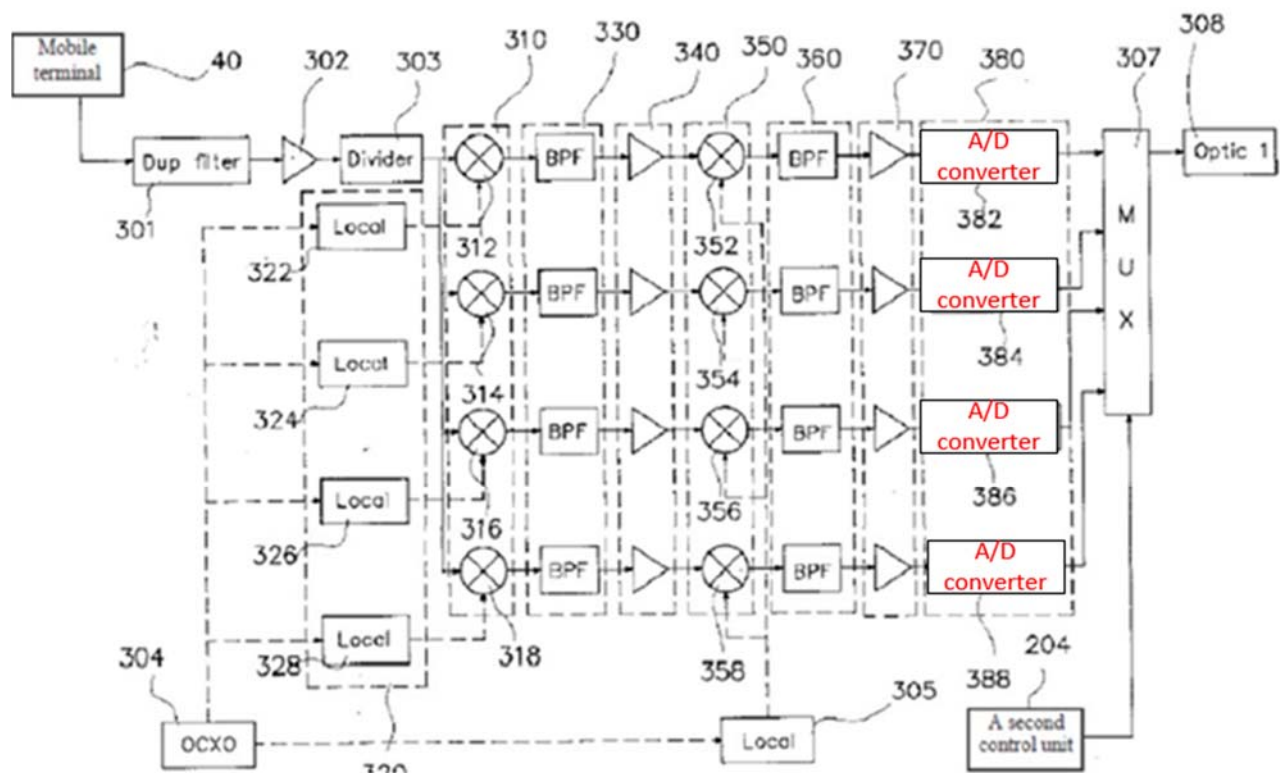

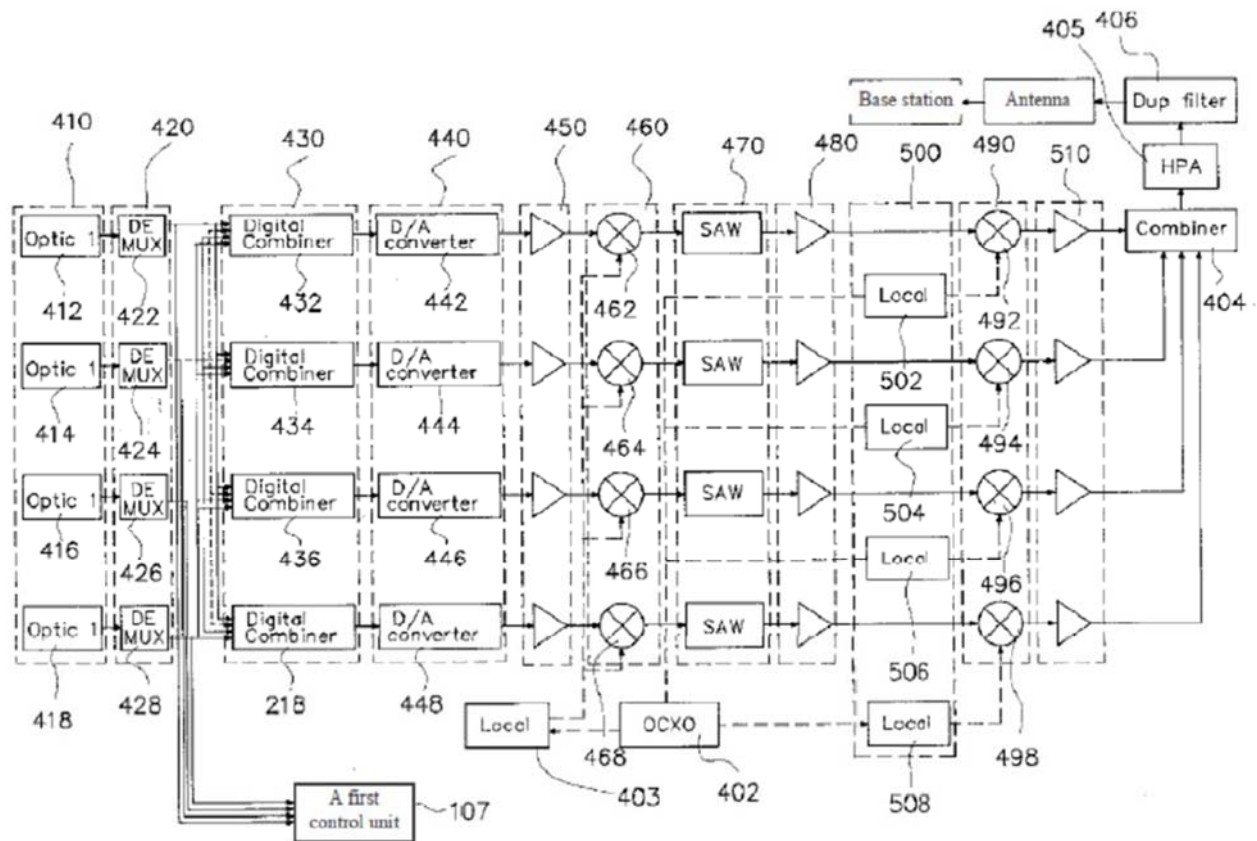

Fig. 4 illustrates example details of the reverse path at a slave unit 30 (*e.g.*, reverse slave unit 300). “RF signals transmitted from the mobile terminals 40 to the reverse slave unit 300 of the slave unit 30 through the antenna are converted to the intermediate frequency signals close to DC..., mixed with the NMS signals transmitted from a second control unit 204, and transmitted to the reverse master unit

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

400 through the optic line.” *Id.*, 4:16-18. RF signals from the mobile terminals 40 are directed through a bi-directional filter 301 to a divider 303. Similar to the master unit divider of Fig. 2, the divider 303 divides the RF signal from the mobile terminals 40 into component frequency bands, where each of those component band signals is processed in parallel through mixer unit 310, BPF 330, amplifier 340, mixer unit 350, BPF 360, and amplifier 370 collectively to transition the signals from their band frequencies to baseband frequency close to DC. *Id.*, 4:26-34. A/D converters 382, 384, 386, 388 sample the baseband signals to convert them to digital representations of the analog component frequency band signals. *Id.*, 3:14-16. Multiplexer 307 multiplexes the four 12-bit digital sample values with 4-bit NMS control data from control unit 204 and applies that 52-bit serial data stream to optic converter 308 for transmission across optic line 50 to master unit 20. *Id.*, 3:56-61.

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

from the slave unit is demultiplexed at a first demultiplexer, with one 12-bit data sample being sent to each of four digital combiners and 4-bit control data to control unit 107. *Id.*, 5:11-12. Thus, demultiplexer 422 sends a 12-bit sample associated with a first frequency band to first digital combiner 432, a 12-bit sample for second band to combiner 434, a 12-bit sample for third band to combiner 436, and a 12-bit sample for fourth band to combiner 438. Demultiplexers 424, 426, 428 similarly send 12-bit samples to each of the digital combiners 432, 434, 436, 438. *Id.*, 5:11-15.

Each digital combiner 432, 434, 436, 438 receives four digital samples associated with its band and “aggregates the same digital signals transmitted from each demultiplexer.” Specifically, each digital combiner performs digital combining “by combining four 12-bit intermediate frequency signals in the same frequency band” to “creat[e] 14-bit intermediate frequency signals.” *Id.*, 4:69; 5:16-17; Ex. 1005, ¶58. Those 14-bit digital signals are then applied to respective D/A converters 442, 444, 446, 448 to provide intermediate frequency signals. *Id.*, 5:18. The intermediate frequency signals are shifted to their respective band frequencies by being amplified at 450, mixed with a step up frequency at 460, filtered at 470, amplified again at 480, mixed with a respective frequency at 490 to recreate the radio frequency signals, and amplified again at 510. *Id.*, 4:73-5:2. “[C]ombiner 404 aggregates the RF signals in different frequency bands [*i.e.*, performs analog combining (Ex. 1005, ¶58)]... amplifies the strengths and level in a first power amplification unit 405, and transmits

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

them to the base station 10 through a fourth bi-directional filter 406” such as via an antenna as depicted in Fig. 5 or an RF cable. *Id.*, 5:27-29.

Oh shows multiple, different example ways of communicating with a base station. For example, a wired connection (*e.g.*, RF cable 60) is illustrated in FIG. 1 between the base station 10 and master unit 20. Oh also illustrates a wireless connection (*e.g.*, antenna in Fig. 5) between the first bi-directional filter 406 of the master unit 20 and the base station 10. A POSITA would understand that the most straightforward, inexpensive system would perform downstream and upstream communications with the base station using the same medium type (*e.g.*, RF cable or wireless). Oh’s explicit disclosure of wired and wireless base station communication options evidences the obviousness of implementing upstream and downstream communications with the base station in a wired implementation or a wireless implementation.

The similarities between Oh’s implementation and the specification examples of the ’286 patent are striking. The only differences of arguable import are the lack of explicit disclosure of expansion units in Oh (addressed by the Schwartz obviousness combination detailed in the companion IPR petition addressing ’286 patent claims), and the fact that Oh divides and then digitizes and reconstructs its analog signals on a per frequency band basis (notice four rows of processing in each of Oh’s Figs. 2-5), while the ’286 patents performs a single digitization of its entire

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

received analog signals.

This difference is a matter of design choice and is of little technical import, and more importantly is irrelevant to the claims. Whether one samples an entirety of a received analog signal for optical transmission and subsequent analog recreation at once, or one divides the received analog signal into its component bands before sampling, transporting, recreating those bands and analog combining them (*e.g.*, at combiner 404), the resulting analog signal at the destination carries the same information. And most importantly, when the claims discuss digitizing an analog signal, there are no recited requirements about how that analog signal is represented by the digital data (*i.e.*, there are no requirements regarding whether the digital data represents only a single analog wave form, rather than representing its (4) component bands that when combined form the analog waveform). Thus Oh's difference in implementation choice is irrelevant to the unpatentability analysis for this matter.¹

Oh is analogous art to the '286 patent because it is in the same field of endeavor (RF data communications) and it is associated with the common problem of extending

¹ Further, the number of bands that Oh processes is configurable (*see*, 3:9 (“*e.g.*, 4 ea.”)). In the nominal case where Oh operates on only a single frequency band channel, Oh's operation (*i.e.*, a single sampling/reconstruction path representing the entire received analog signal) is almost identical to that of the '286 patent.

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

RF data communications into hard to reach areas. Ex. 1005, ¶¶70-85; Ex. 1007, 2:4-13.

2. Overview of Allpress

Allpress is a U.S. Patent filed in July 1998 entitled “Software-Defined Transceiver for a Wireless Telecommunications System,” that describes techniques for receiving and transmitting wireless telecommunications using a software-defined transceiver. Ex. 1021, Abstract. Allpress states that software transceivers can avoid the need for “duplicative hardware.” Allpress further states that its “generic architecture” is not “standard specific” and thus can be easily ported to different implementations without modification, a benefit that would not be possible with a hardware implementation with hardwired physical components. Ex. 1021, 2:5-50. Allpress states that its software transceivers may be implemented in a variety of locations such as “in a base station or at a location other than a base station,” including locations that communicate with base stations. Ex. 1021, 3:46-48.

Fig. 4 depicts a software-based RF receiver, and Fig. 7 depicts a software-based RF transmitter.

Allpress describes its receiver stating:

FIG. 4 depicts a schematic diagram of a portion of receiver 301 of the illustrative embodiment of the present invention, which comprises RF-to-IF converter 401, analog-to-digital converter 402, first receiving resampler 403, wide-band down-converter 404, narrow-band selector 405, second receiving resampler 406, demodulator 407 and controller 303-R, interconnected as shown. First receiving resampler 403, wide-band down-converter 404, narrow-band selector 405, and second receiving resampler 406 are software-defined devices.

Ex. 1021, 4:43-53.

Allpress further describes its transmitter stating:

As depicted in FIG. 7 transmitter 302 comprises IF-to-RF converter 701, digital-to-analog converter 702, second transmitting resampler 703, wide-band up-converter 704, narrow-band selector 705, first transmitting resampler 706, modulator 707 and controller 303-T, interrelated as shown. For illustrative purposes controller 303-T, which controls transmitter 302, and controller 303-R, which controls receiver 301, are depicted as separate devices. It should be understood, however, that a single controller can be used to control both the receiving and transmitting sections. Second transmitting resampler 703, wide-band up-converter 704, narrow-band selector 705, and first transmitting resampler 706 are software-defined devices.

Ex. 1005, ¶¶96-97; Ex. 1021, 8:30-42.

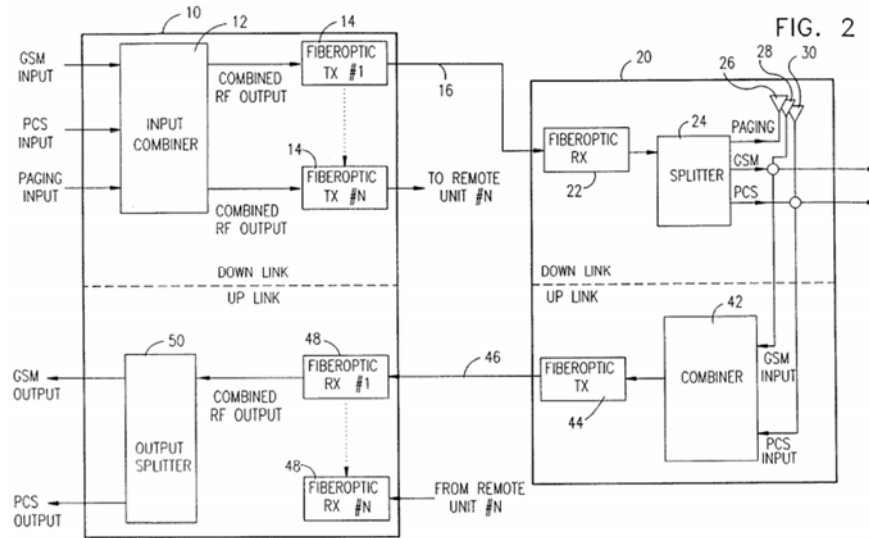

3. Overview of Farber

Farber is a U.S. Patent filed in July 1997 entitled “Communications System,” that describes a wireless communications station employing optical fibers. Ex.

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

1022, 1:4-6. Farber discloses the use of fiber in an antenna system for reaching difficult coverage areas such as buildings, as illustrated in Fig. 1, and other shadowed areas that is very similar to the digital system of Oh. *Id.*, 4:30-33. Farber states that the optical fibers “may be single or multi mode.” *Id.*, 2:59-60. With reference to Fig. 2, Farber describes that “[p]referably the fiberoptic transmitter employs a vertical cavity surface emitting laser or an edge emitting laser coupled to a single or multi-mode fiber.” *Id.* 2:51-53; Ex. 1005, ¶88.

B. Ground 1a: Claims 1-4, 7-17, 19-34, and 37-39 Are Obvious Over Oh

1. Independent Claim 1

(a) Preamble: “A system for use with a coverage area in which one or more wireless units wirelessly transmit using a wireless radio frequency spectrum, the system comprising:”

To the extent the preamble of claim 1 is limiting, it is rendered obvious by Oh.

As discussed above, Oh discloses a Digital Optic Repeater system that receives RF signals, from a base station 10 at a master unit 20 and from mobile terminals 40 at remote slave units 30. The optic repeater 1 is installed in a radio wave shadow area and converts received analog signals to intermediate frequency signals (*e.g.*, close to DC in the example at 3:11-14) and then to digital signals for mutual transmission and reception to one another across optic lines 50. Ex. 1007, Abstract, Fig. 1. At a destination unit, the digital signals transmitted across the optic lines 50 are converted to analog signals, and upconverted to RF signals for transmission to their destination

(e.g., base station 10 or mobile terminals 40 (e.g., at 800 MHz, 1800MHz)). Ex. 1007, Abstract, Fig. 1, 3:19, 4:40. Fig. 5 of Oh illustrates the communications between master unit 20 and the base station 10 may be wireless communications via an antenna.

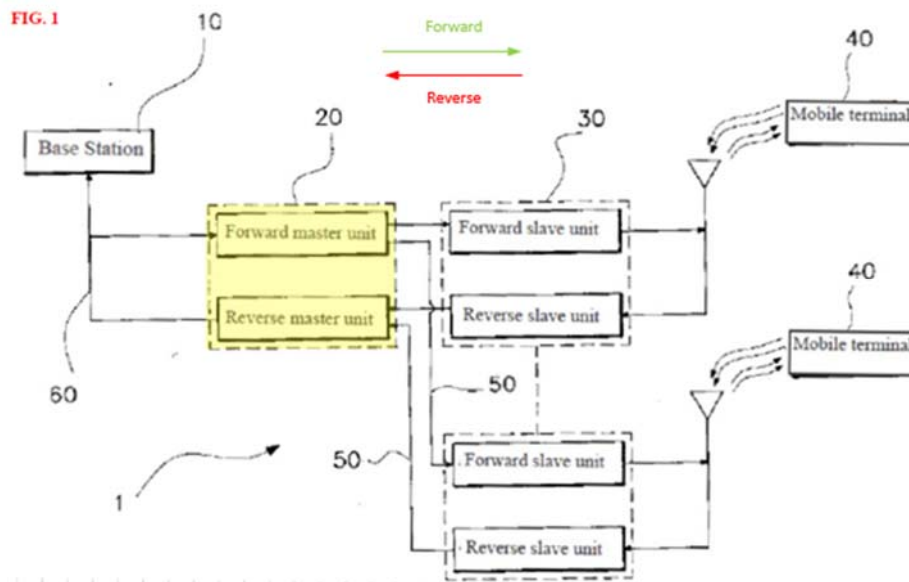

Oh therefore renders obvious each limitation recited in the preamble of claim 1 by disclosing a system (Fig. 1) for use with a coverage area in which one or more wireless units (40) wirelessly transmit using a wireless radio frequency spectrum (e.g., 800 MHz, 1800MHz). Ex. 1005, ¶¶499-500.

- (b) Elements 1 and 2: “a first unit; and a plurality of second units communicatively coupled to the first unit using at least one communication medium, wherein each of the plurality of second units is associated with a portion of the coverage area;”

Elements 1 and of claim 1 is rendered obvious by Oh.

As discussed above and as shown in Fig. 1, Oh’s master unit 20 transmits/receives analog signals to/from the base station and relays digital samples of those analog signals to/from remote slave units 30 across optic lines 50. Ex. 1007, 2:70-3:1; 4:62-64.

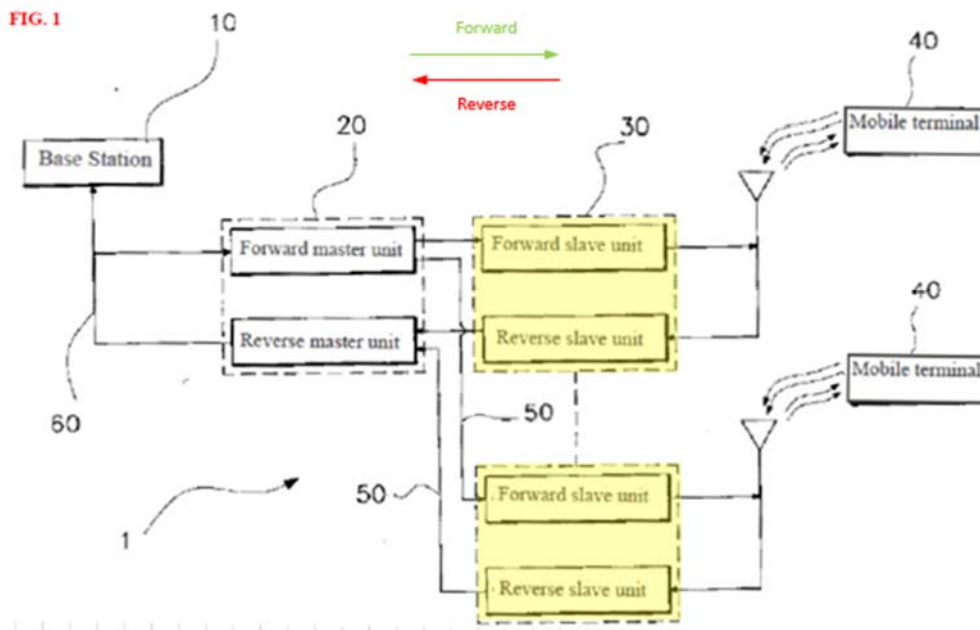

Oh’s master unit 20 is analogous to the ’286 patent’s digital host unit (DHU) 20 which interfaces with a wireless interface device (WID) 10 that in embodiments comprises a base station (Ex. 1003, 4:45-49). And like Oh’s master unit 20, on the forward path the ’286 patent’s DHU “receives RF signals from WID 10 [*i.e.*, base station] and converts the RF signals to digital RF signals. DHU 20 further optically

transmits the digital RF signals to multiple DRUs 40.”

Oh’s slave units 30 convert “the digital signals transmitted from the master unit 20 through the optic line 50 to intermediate frequency signals, analog signals; converts them to the RF signals and transmits them to the mobile terminals 40.” Ex. 1007, 3:47-49. Oh’s slave units 30 further convert analog signals from the mobile terminals 40 to digital signals and transmit them to master unit 20. *Id.*, 4:23-25.

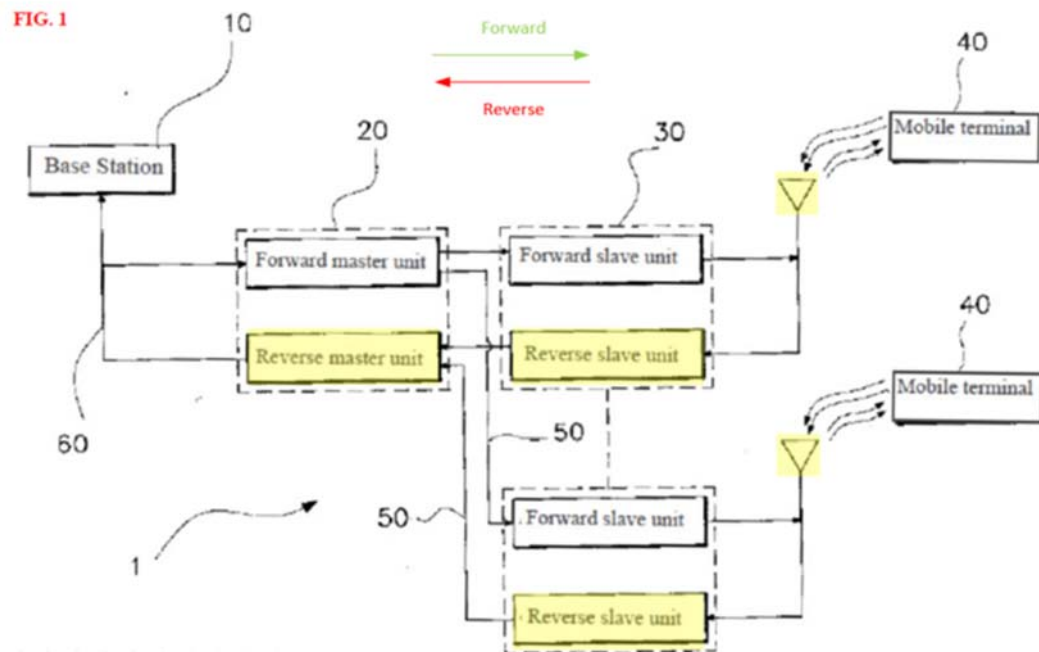

Oh's slave units 30 are analogous to the '286 patent's digital remote units (DRUs) that digitally communicate with the DHU via optic cables (Ex. 1003, 4:3-6) and wirelessly communicate with devices in their area (*e.g.*, via antenna 599).

Thus Oh renders obvious a first unit (20); and a plurality of second units (30) communicatively coupled to the first unit using at least one communication medium (50), wherein each of the plurality of second units is associated with a portion of the coverage area. Ex. 1005, ¶¶501-503.

- (c) **Element 3: “wherein each of the plurality of second units receives a respective analog wireless signal comprising the radio frequency spectrum and any transmissions from any of the wireless units that are within the portion of the coverage area associated with that second unit,”**

Oh discloses that each reverse slave unit 300 “converts the RF signals, analog

signals, transmitted from the mobile terminals 40... to the digital signals; and transmits them to the master unit 20.” Ex. 1007, 4:22-25. Fig. 1 depicts multiple slave units 30 receiving analog RF signals from mobile terminals 40.

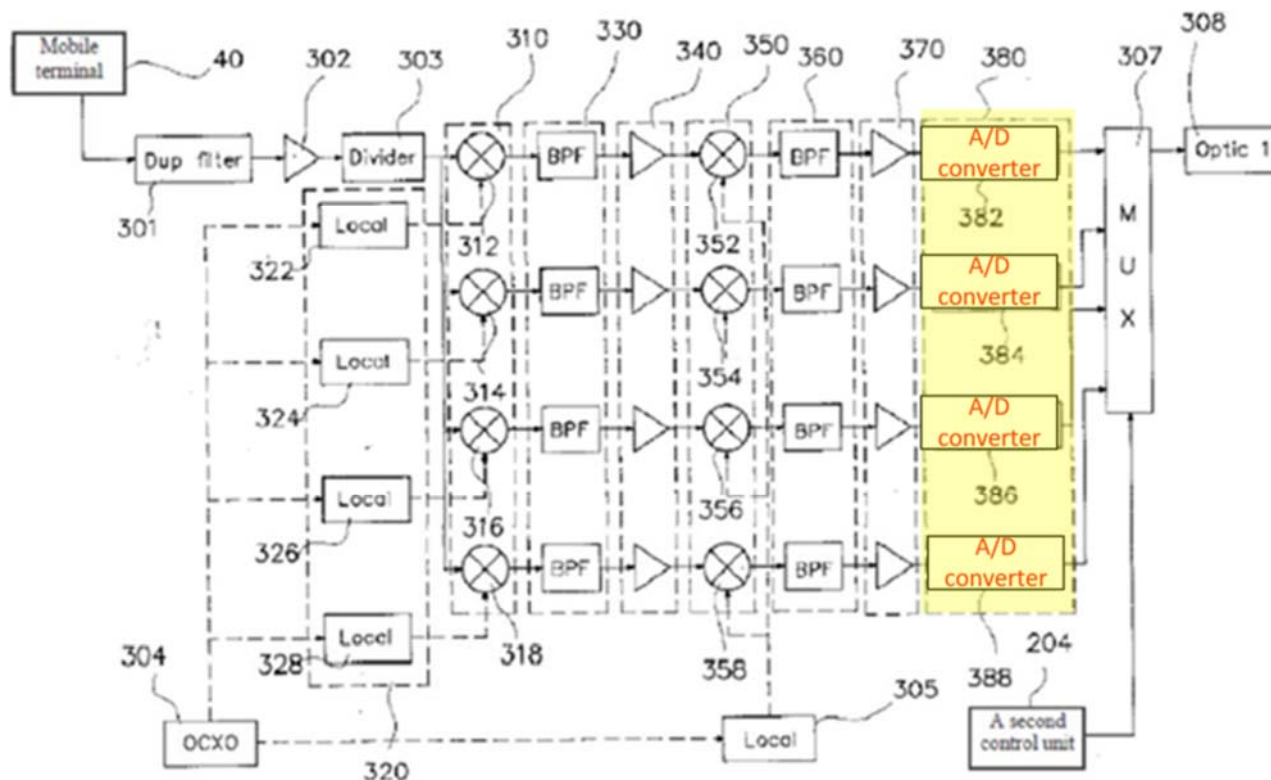

Thus Oh discloses each of the plurality of second units (30) receives a respective analog wireless signal comprising the radio frequency spectrum and any transmissions from any of the wireless units (40) that are within the portion of the coverage area associated with that second unit. Ex. 1005, ¶¶504-505.

- (d) **Element 4: “wherein each of the plurality of second units generates respective digital RF samples indicative of the respective analog wireless signal received at that second unit;”**

Oh discloses that each reverse slave unit 300 “converts the RF signals, analog signals, transmitted from the mobile terminals 40 through a third bi-directional filter

301, to the digital signals.” Ex. 1007, 4:23-25. That digitization is illustrated at Fig. 4 where “A/D converter unit 380 converts the intermediate frequency signals, analog signals, to the digital signals.” *Id.*, 4:56-67.

FIG. 4

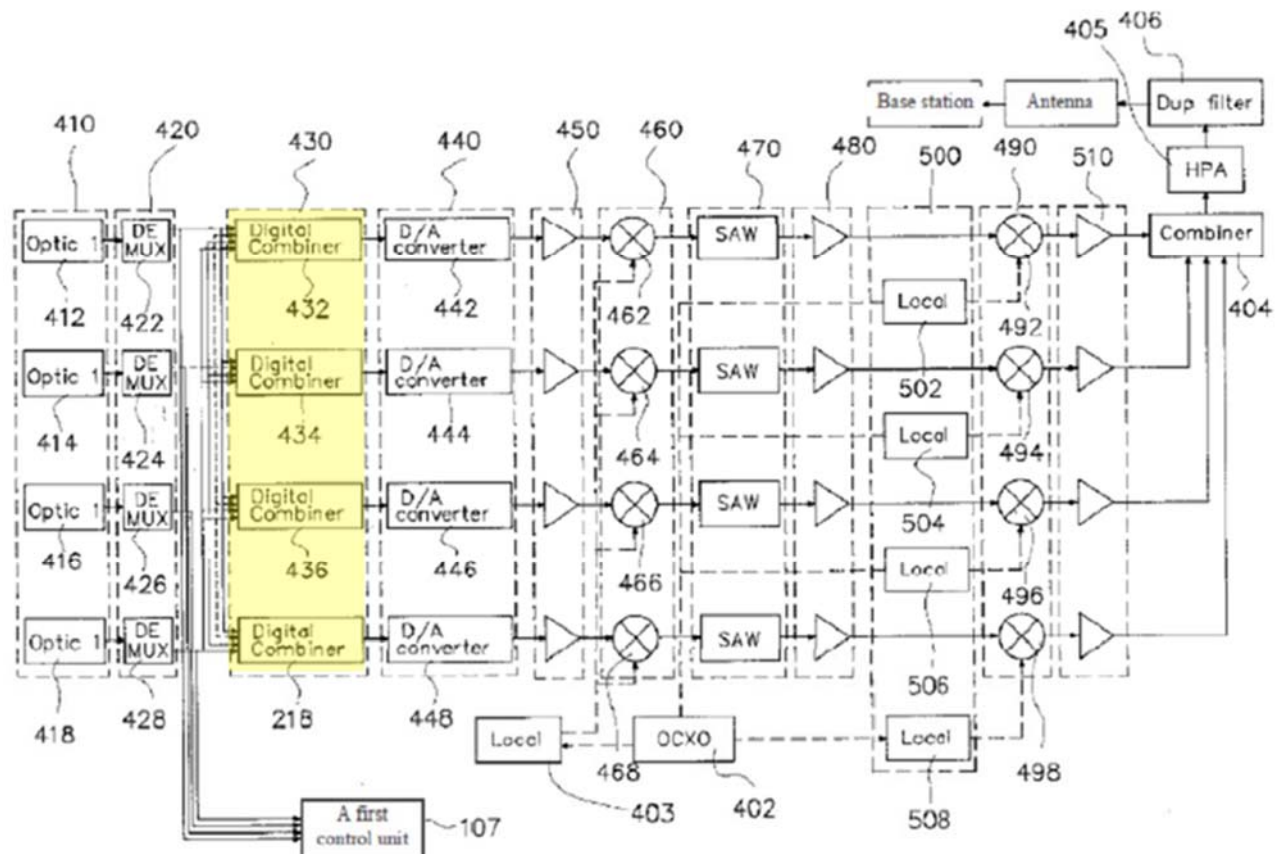

Patent Owner has made clear in a prior litigation that “digital radio frequency (RF)” as that term is used in the ’286 patent refers to sampling of any of baseband signals, intermediate frequency signals, or radio frequency signals. *See*, Ex. 1008, Acampora Report, ¶136 (“Accordingly, the baseband digital samples, any intermediate frequency digital samples, and any radio frequency digital samples are all referred to a[s] being digital RF.”) Oh’s disclosure of A/D conversion (*i.e.*, sampling) of intermediate frequency signals, including signals down converted to

Thus Oh renders obvious each of the plurality of second units (30) communicates the respective digital RF samples generated by that second unit to the first unit (20) using the at least one communication medium (50). Ex. 1005, ¶¶509-510.

- (f) **Element 6: “wherein the first unit digitally sums corresponding digital RF samples received from the plurality of second units to produce summed digital RF samples;”**

Oh’s master unit 20 includes a digital combiner unit 430 that performs digital combining by aggregating digital signals transmitted from each demultiplexer 422, 424, 426, 428 of demultiplexer unit 420. Ex. 1007, 4:68-70; Ex. 1005, ¶58.

FIG. 5

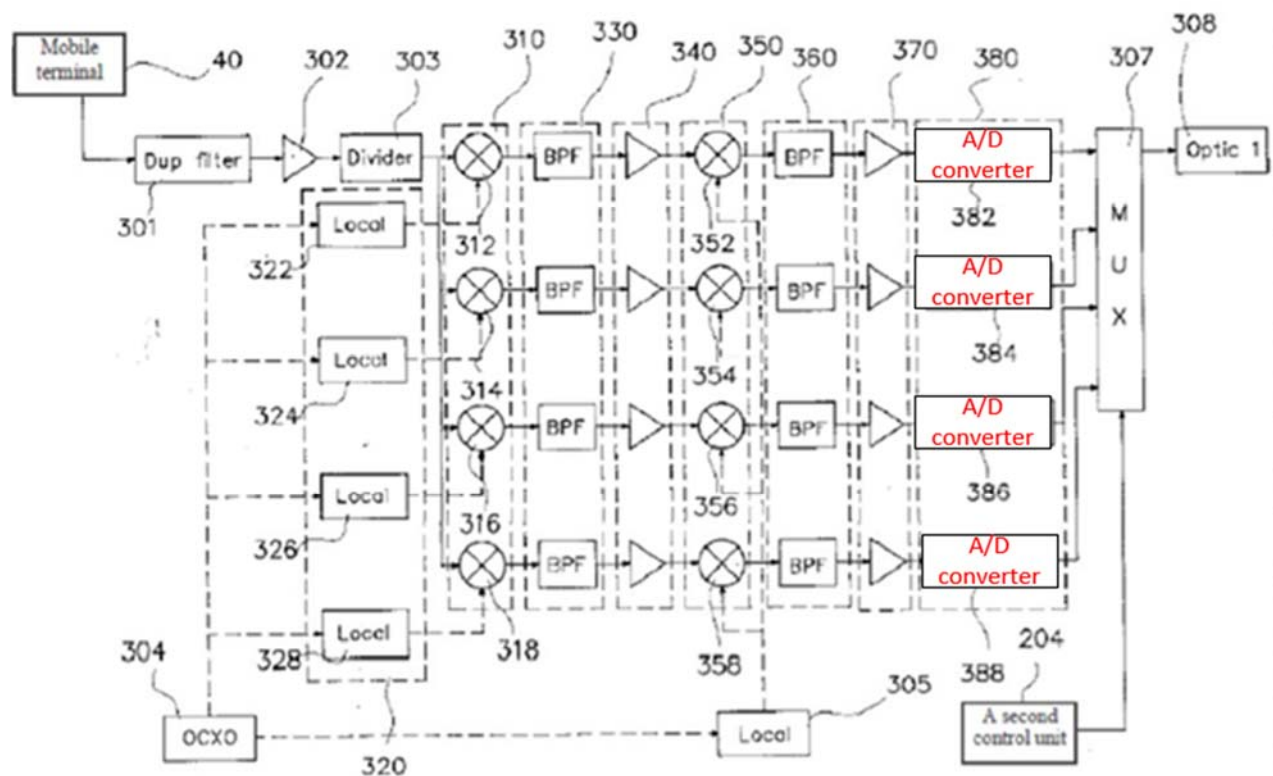

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

Those demultiplexers at 420 receive data from individual remote slave units 30 at 410.

As depicted in Fig. 4, each slave unit 30 receives an analog signal from mobile terminals 40, divides the received analog signal into its component frequency bands at 303 and downconverts the frequency band signals to near DC at 310-370. Ex. 1007, 4:26-34. The downconverted band signals are then sampled at 380 to create 12-bit digitized radio frequency signals. *Id.*, 4:56-61. The multiplexer 307 multiplexes the four 12-bit samples with 4 bits of control data from 204 to form 52-bit serial data signals that are forwarded to master unit 20. *Id.*

FIG. 4

Referring back to Fig. 5, each demultiplexer 422, 424, 426, 428 receives a 52-bit signal from its respective slave unit 30. Each demultiplexer forwards 12-bits of sample

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

data to the appropriate digital combiner associated with the proper frequency band for that 12-bit sample and forwards its 4 bits of control data to control unit 107. Upon receiving four 12-bit signals (one from each of demultiplexer 422, 424, 426, 428), each digital combiner 432, 434, 436, 438 performs digital combining on those 12-bit signals to “creat[e a] 14-bit intermediate frequency signal[] by combining² four 12-bit intermediate frequency signals in the same frequency band.” Ex. 1005, ¶80 (Dr. Baker testifying that whether referred to as “adding,” “aggregating,” or “combining,” the result of digital combiners 432, 434, 436, 438 processing of the four 12-bit signals to create a 14-bit signal is a “digital sum:” *e.g.*, 1010 1010 1010 (2,730) + 1100 1100 1100 (3,276) + 1111 1111 1111 (4,095) + 0000 1100 1100 (204) = 10 1000 0100 0001 (10,305)); Ex. 1007, 5:16-17.³ Those 14-bit signals are then converted to analog signals

² The translation originally commissioned by SOLiD translated this word as “added.” In parallel litigation in the UK, CommScope requested that it be translated as “combined.” The translator is agreeable to using “combined,” and that is reflected in Ex. 1007 submitted herewith.

³ This is evidenced by the CommScope patents themselves referring to their “sum” operation as “combining.” *See*, Ex. 1003, 5:8-22 (“Both DHU and DEU split signals in the forward path and **sum signals in the reverse path**...Splitting and **combining**

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

(*i.e.*, analog combining) at 440, upconverted, combined, and transmitted to the base station 10. *Id.*, 5:17-29; Ex. 1005, ¶58.

Thus Oh renders obvious the first unit (20) digitally sums (at 430) corresponding digital RF samples received from the plurality of second units (30) to produce summed digital RF samples. Ex. 1005, ¶¶511-514.

(g) Element 7: “wherein the system is configured so that an input used for base station processing is derived from the resulting summed digital RF samples.”

The term “base station processing” is not used in the ’286 patent specification. But the Patent Owner has made clear its view that “base station processing” encompasses first (*i.e.*, host) unit functionality. In its complaint, Patent Owner maps Distribution and Aggregation Unit (DAU) to the “first unit” of claim 1, element 1. Ex. 1024, ¶44. Patent Owner then alleges that the same DAU alleged to be the “first unit” performs the “base station processing” of element 7. Specifically, Patent Owner states “DAU is configured to derive an input used for base station processing from the resulting summed digital RF samples. As seen, for example, in Figure 2.1 above, the upstream signal of the DAU is used as an input to a base station for base station processing.” Ex. 1024, ¶51. Thus Patent Owner has argued that “base station

the signals in a digital state avoids the combining and splitting losses experienced with an analog system.”)

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

processing” means processing signals in preparation/transmission of those processed signals to a base station, including at the first/host unit.

Claim 3 further corroborates that “base station processing” can encompass first/host unit functionality. Claim 3 states that “the base station processing functionality is at least one of: co-located with the first unit and remote from the first unit.” Because claim 1 must necessarily be at least as broad, if not broader, than claim 3 (35 U.S.C. § 112, ¶4), “base station processing” in claim 1 also encompasses base station processing “co-located with the first unit.”

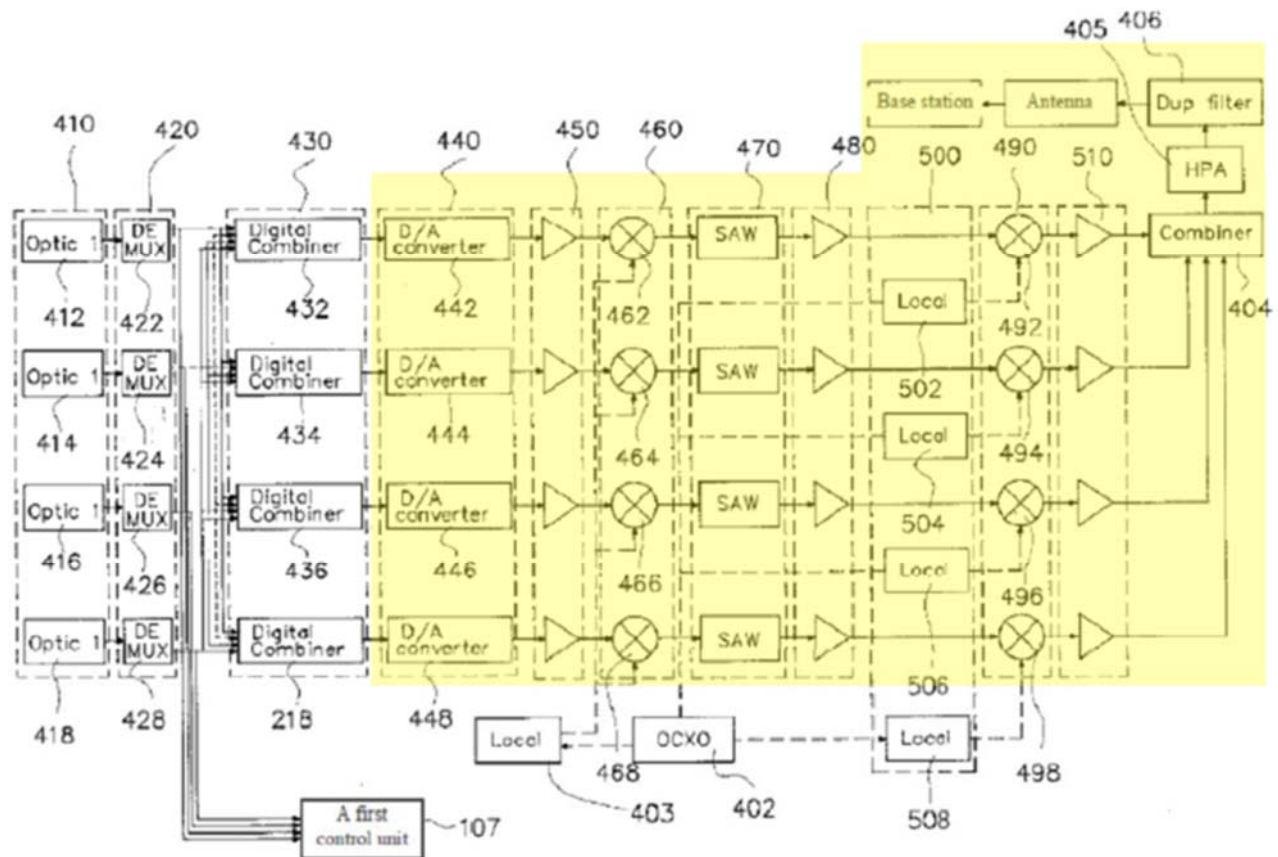

Further, the ’286 patent specification lacks description of performing processing of signals post-digital summing at a base station other than mere transmission of an analog signal to the base station. Ex. 1003, 5:59-63.

Thus, the base station processing recited by claim 1 cannot be limited to signal processing that is performed at a base station, claim 3 necessarily means that “base station processing” can encompass first/host unit functionality, and because Patent Owner has accused what it alleges to be a first/host unit of performing base station functionality in litigation. Instead, “base station processing” should be understood for purposes of this proceeding to include processing signals in preparation/transmission of those processed signals to a base station including at a first/host unit.

Oh renders that limitation obvious. Following the digital summing operation referenced above in addressing element 6, the summed digital data values in Oh are

converted to analog signals, up converted to the appropriate frequency signals associated with their particular bands to create component analog signals, that are then combined and transmitted to a base station via an antenna.

FIG. 5

Specifically Oh states:

After creating 14-bit intermediate frequency signals by combining four 12-bit intermediate frequency signals in the same frequency band, said digital combiner transmits them to a first D/A converter unit 440. Each D/A converter 442, 444, 446, and 448 of said first D/A converter unit 440 converts 14-bit digital signals to the intermediate [frequency] signals, analog signals; and transmits 1.23MHz or 1.5MHz intermediate frequency signals to each mixer 462, 464, 466, and 468 of a third mixer

unit 460 through a third amplification unit 450. Said third mixer unit 460 outputs 70MHz intermediate frequency signals by mixing 1.23MHz or 1.5MHz intermediate frequency signals transmitted from a first D/A converter unit 440 with 68.77MHz or 68.5MHz oscillating frequency transmitted from a third local unit 403. The intermediate frequency signals outputted from said third mixer unit 460 are transmitted to a fourth mixer unit 490 through a first saw filter unit 470 and a fourth amplification unit 480. Said fourth mixer unit 490 mixes the oscillating frequency in different frequency bands transmitted from a fourth local unit 500 with 70MHz intermediate frequency signals; and transmits 800MHz RF signals in different frequency bands to a first combiner 404 through a fifth amplification unit 510.

Ex. 1007, 5:16-26. The analog signals are combined (*i.e.*, analog combining) at 404 to “aggregate[] the RF signals in different frequency bands transmitted from four mixers 492, 494, 496, and 498,” and are amplified at 510 and run through a bi-directional filter 406 to an antenna and a base station. Ex. 1005, ¶58.

Thus Oh renders obvious the system being configured so that an input used for base station processing is derived from the resulting summed digital RF samples (the output of 430 is used as an input to circuitry at 440, 450, 460, 470, 480, 490, 520, 404, 405, 406 in preparation for transmission to the base station).

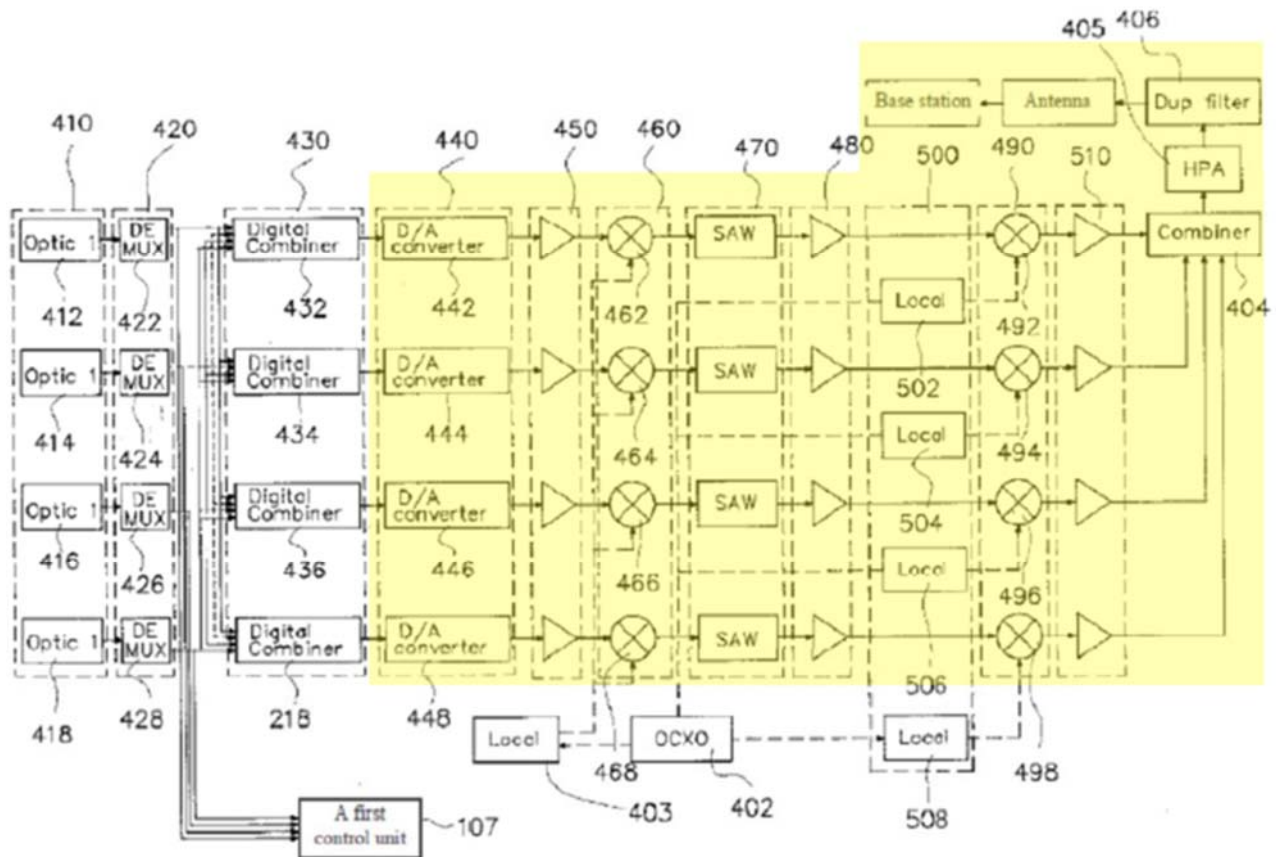

Thus Oh renders claim 1 obvious. Ex. 1005, ¶¶515-520.

2. Dependent Claim 2

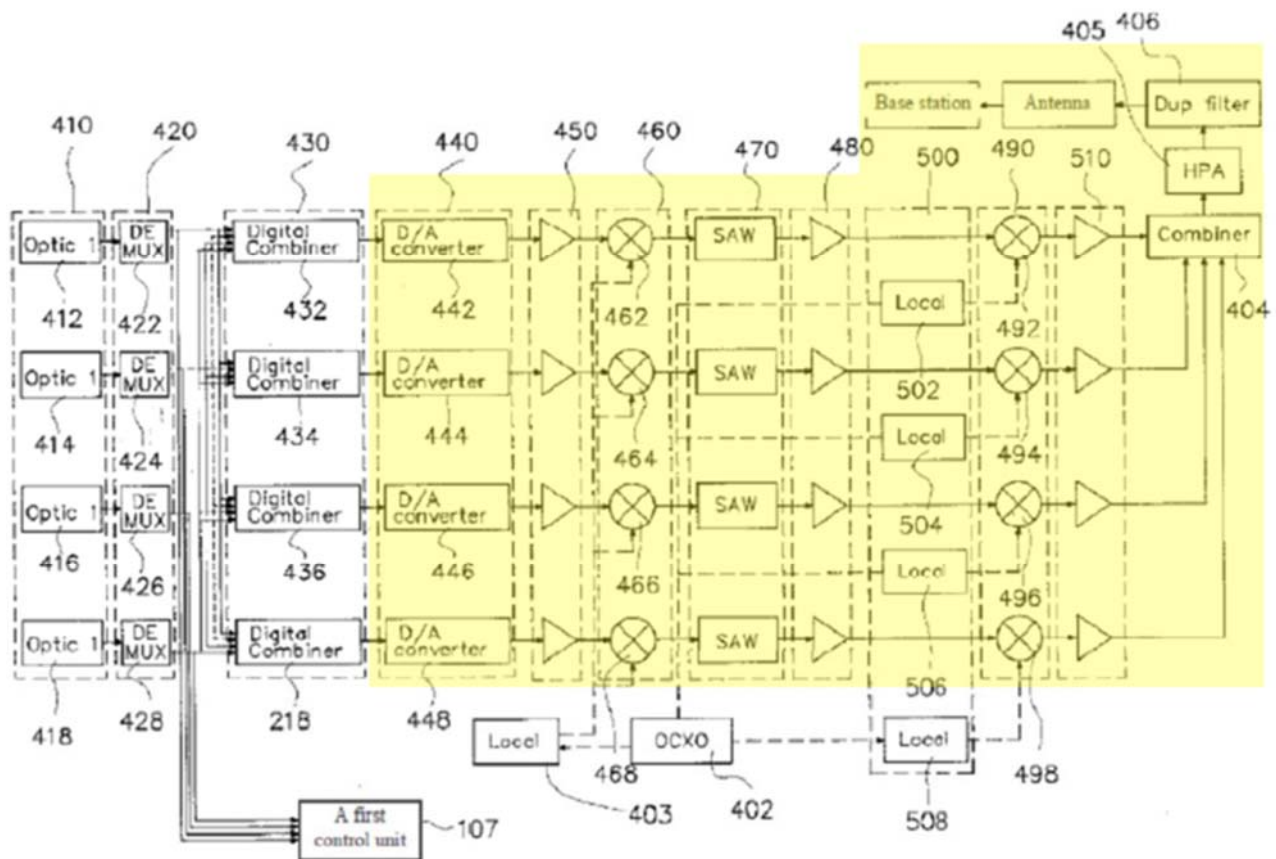

Claim 2 recites “the system includes base station signal processing functionality

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

configured to perform base station processing.” As discussed above with reference to claim 1, element 7, the digitally summed values from 430 are processed through the remainder of Fig. 5 of Oh in preparation for transmission to the base station, such as via the antenna depicted in Fig. 5. That processing in preparation for transmission to the base station includes D/A conversion at 440, amplification at 450, an initial upconversion at 460 followed by filtering at 470 and amplification at 480. Further upconversion of the frequency bands occurs at 490, followed by amplification at 510 and analog combining at 404 to form the replicated analog signal for transmission to the base station. That combined signal is amplified at 405 and transits a duplex filter 406 before transmission. Ex. 1007, 5:16-26.

3. Dependent Claim 3

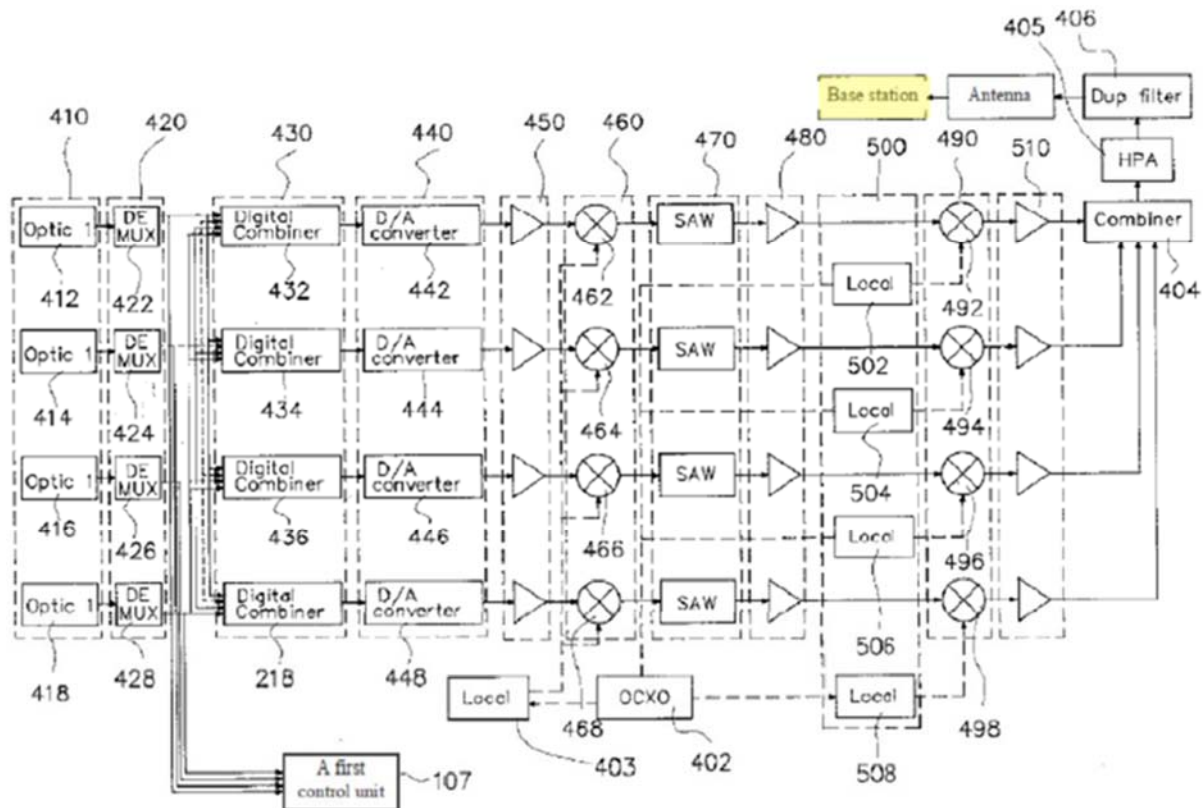

4. Dependent Claim 4

highlighted below. Oh states that its “base station” “constitutes the mobile telecommunication network” and is thus involved in transmission of processed signals.

Ex. 1007, 2:4-5.

FIG. 5

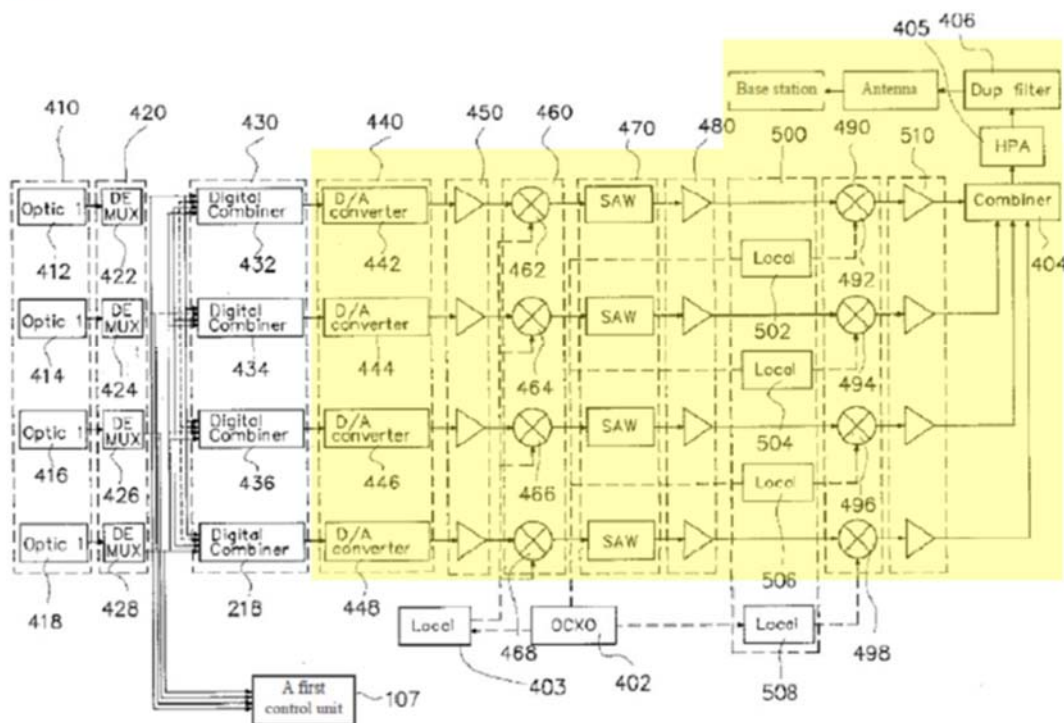

Thus Oh renders obvious the system comprises at least a portion of a base station (highlighted Fig. 5 Base station, “which constitutes the mobile telecommunication network”) for performing the base station processing (processing signals in preparation/transmission of those processed signals to a base station). Ex. 1005, ¶¶525-526.

5. Dependent Claim 7

Claim 7 recites “the system is configured to convert the summed digital RF

samples to a replicated analog wireless radio frequency signal.” Oh discloses that the outputs of digital combiner unit 430 (*i.e.*, the summed digital RF samples), are converted to analog signals at 440, upconverted to RF frequency signals at 450, 460, 470, 480, 490, 510, and combined at 404 (*i.e.*, analog combining) to form an analog signal that is transmitted to the base station. Ex. 1007, 5:16-26; Ex. 1005, ¶58. .

FIG. 5

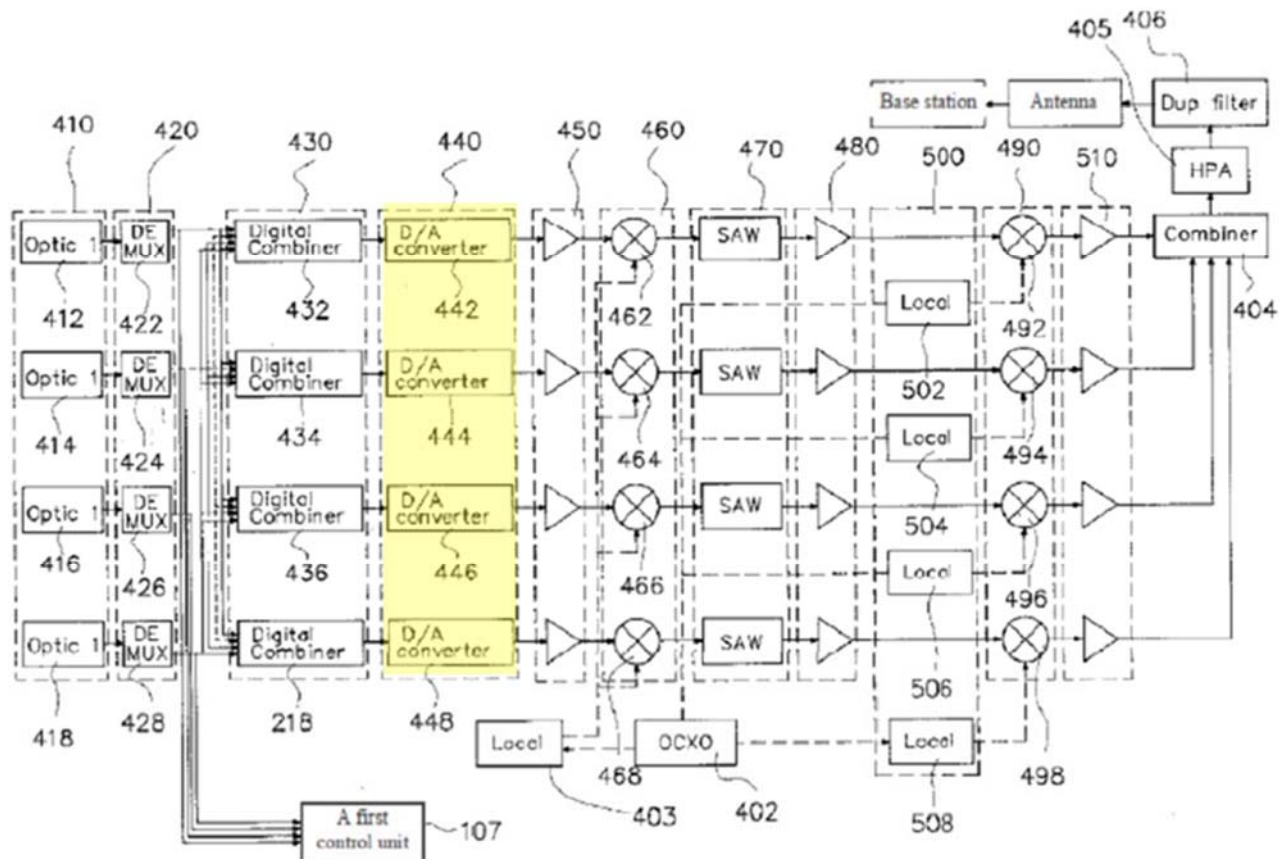

Thus Oh discloses the system is configured to convert the summed digital RF samples (outputs of 430) to a replicated analog wireless radio frequency signal (via 450, 460, 470, 480, 490, 510, 404). Ex. 1005, ¶¶527-528.

6. Dependent Claim 8

Claim 8 recites “the system comprises a digital-to-analog converter to convert the summed digital RF samples to the replicated analog wireless radio frequency

signal.” As noted above, Oh discloses D/A converter unit 440 that receives the summed digital RF samples from 430 and converts them to analog signals, prior to those analog signals being up converted to form the replicated analog wireless frequency signal.

FIG. 5

Thus Oh renders obvious the system comprises a digital-to-analog converter (440) to convert the summed digital RF samples (from 430) to the replicated analog wireless radio frequency signal. Ex. 1005, ¶¶529-530.

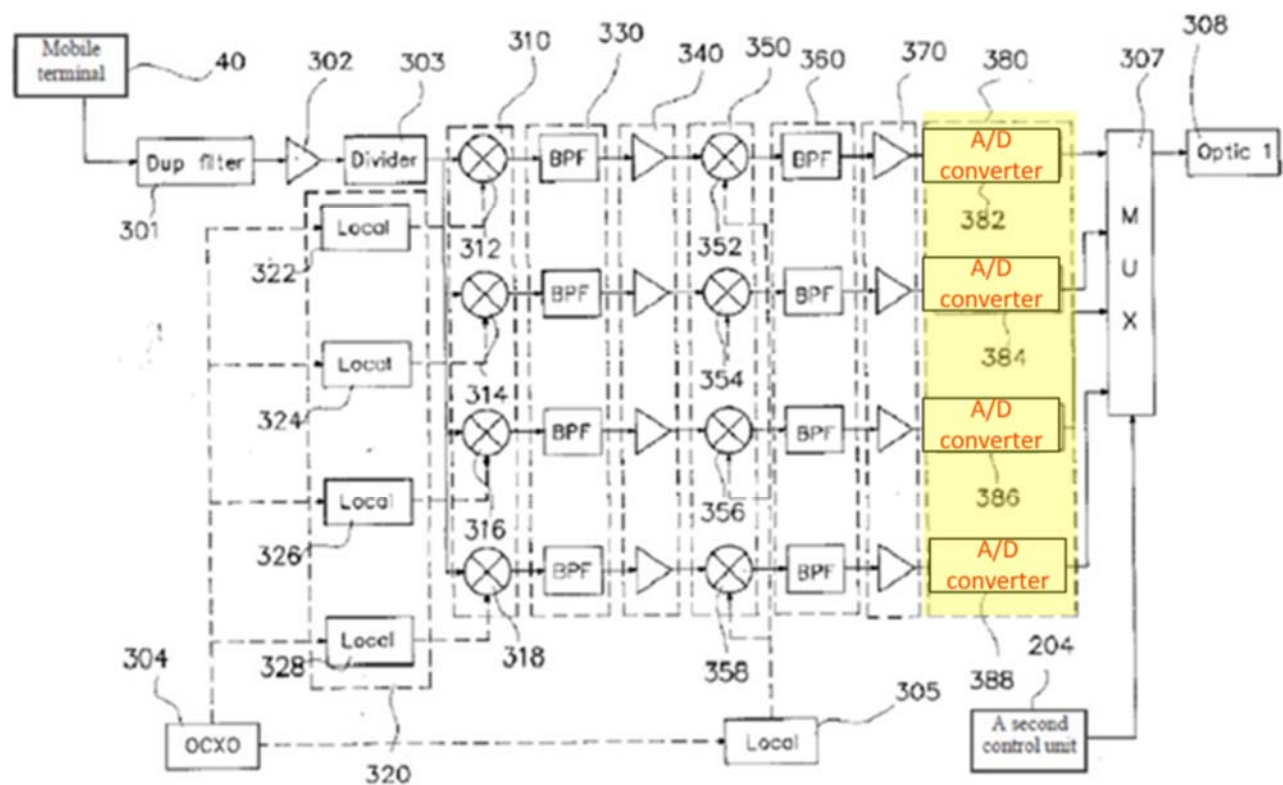

7. Dependent Claim 9

Claim 9 recites that “each of the plurality of second units comprises: a respective analog-to-digital converter to digitize the respective analog wireless radio frequency

signal received at that second unit in order to produce the respective digital RF samples.”

Oh discloses that each reverse slave unit 300 “converts the RF signals, analog signals, transmitted from the mobile terminals 40 through a third bi-directional filter 301, to the digital signals.” Ex. 1007, 4:23-25. That digitization is illustrated at Fig. 4 where “A/D converter unit 380 converts the intermediate frequency signals, analog signals, to the digital signals.” *Id.*, 4:56-67.

FIG. 4

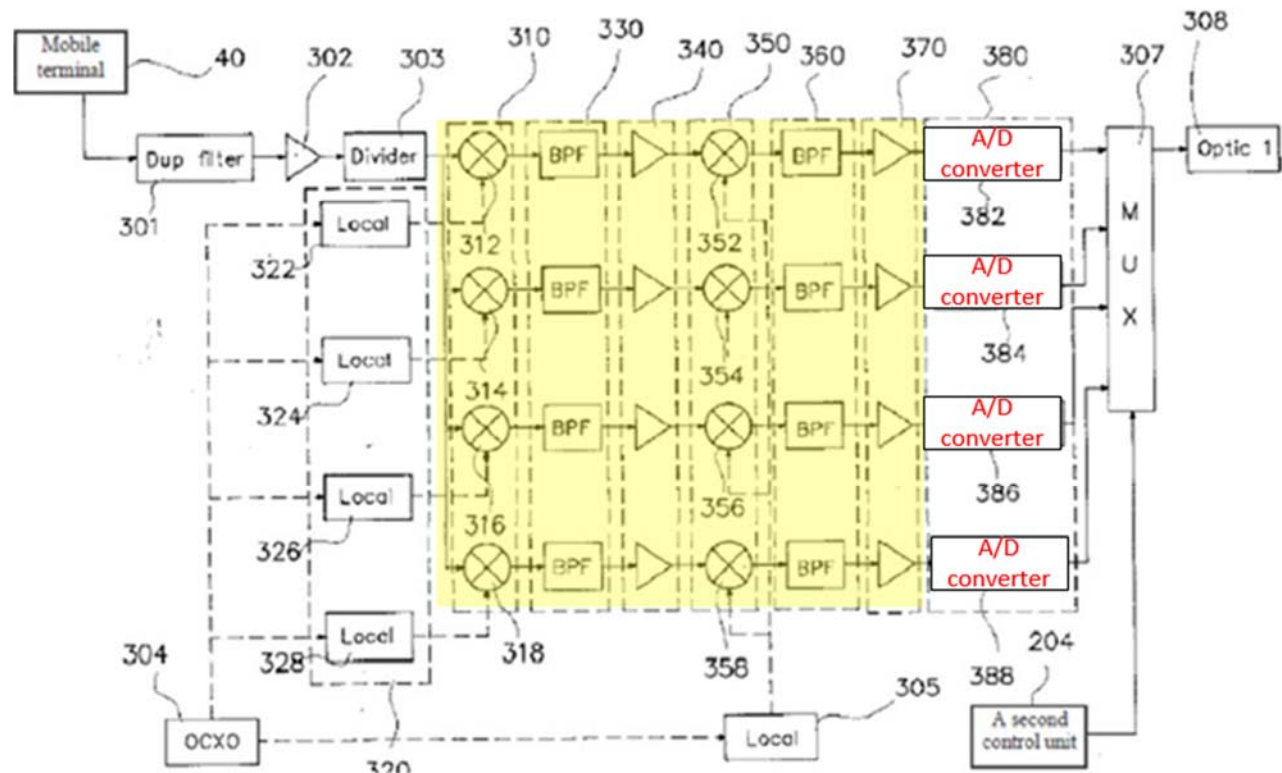

Thus, Oh discloses each of the plurality of second units (30) comprises: a respective analog-to-digital converter (380) to digitize the respective analog wireless radio frequency signal received at that second unit in order to produce the respective

digital RF samples. Ex. 1005, ¶¶531-533.

8. Dependent Claim 10

Claim 10 recites “each of the plurality of second units generates the respective digital RF samples indicative of the respective analog wireless signal received at that second unit by frequency shifting the respective analog wireless radio frequency signal received at that second unit and digitizing the frequency-shifted analog wireless radio frequency signal.” Oh discloses that each remote slave unit 30 includes circuitry for downconverting RF signals received from mobile terminals 40 to near DC prior to performing A/D conversion at 380. Specifically, a first stage of downconverting at 310 transitions signals from their near 800MHz bands to ~70MHz, followed by a second frequency shift from ~70MHz to near DC. Ex. 1007, 4:43-55.

FIG. 4

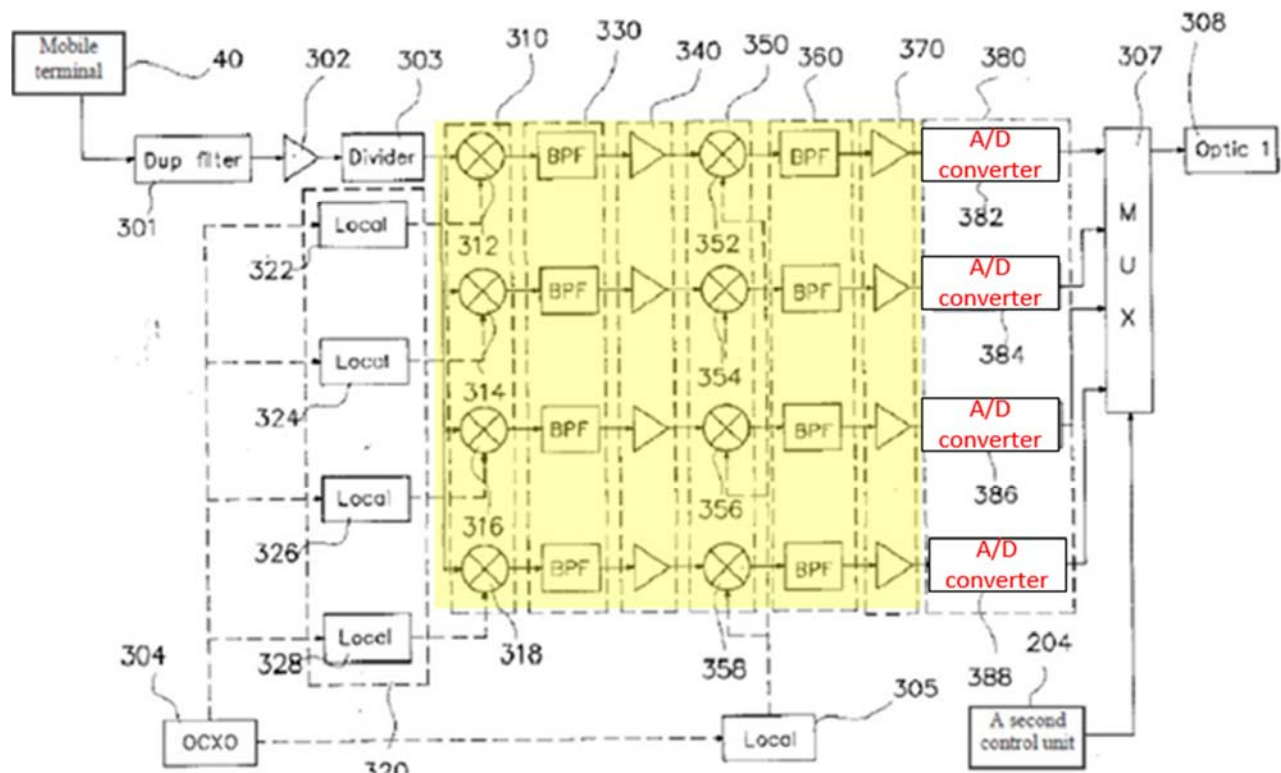

Thus Oh renders obvious each of the plurality of second units (30) generates the respective digital RF samples (at 380) indicative of the respective analog wireless signal received at that second unit (from 40) by frequency shifting (downconverting at 310, 350) the respective analog wireless radio frequency signal received at that second unit and digitizing (380) the frequency-shifted analog wireless radio frequency signal. Ex. 1005, ¶¶534-535.

9. Dependent Claim 11

Claim 11 recites “each of the plurality of second units generates the respective digital RF samples indicative of the respective analog wireless signal received at that second unit by down converting the respective analog wireless radio frequency signal

received at that second unit and digitizing the down-converted analog wireless radio frequency signal.” As discussed above with reference to claim 10, each Oh remote slave unit downconverts received analog signals from ~800Mhz→~70MHz→~DC at 310, 350 prior to A/D conversion at 380.

FIG. 4

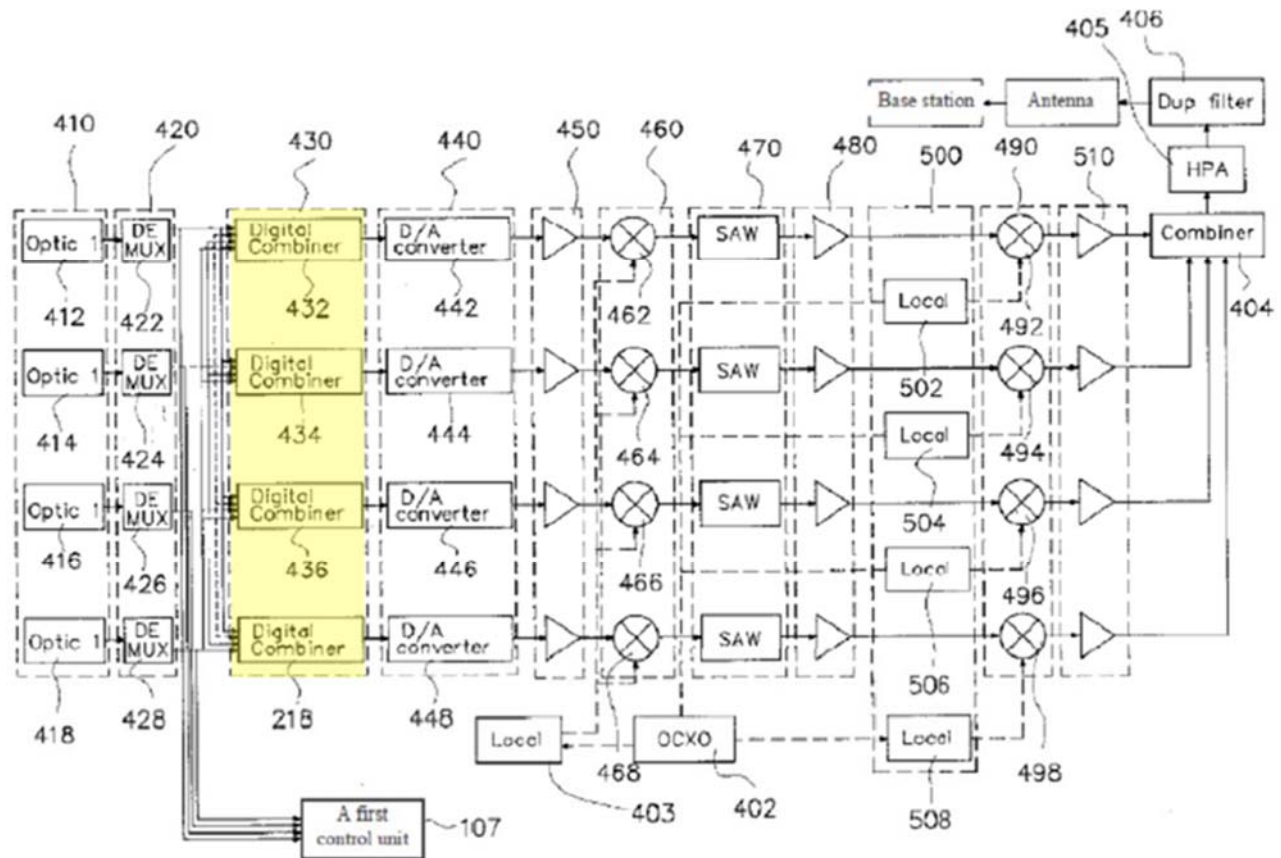

Thus Oh renders obvious each of the plurality of second units (30) generates the respective digital RF samples indicative of the respective analog wireless signal received at that second unit by down converting (at 310, 350) the respective analog wireless radio frequency signal received at that second unit and digitizing (at 380) the down-converted analog wireless radio frequency signal. Ex. 1005, ¶¶536-537.

10. Dependent Claim 12

Claim 12 recites “the first unit digitally sums the corresponding digital RF samples received from the plurality of second units in order to produce the summed digital RF samples at a resolution greater than a resolution of the digital RF samples being summed.” Oh discloses that its A/D converter unit 380 of slave unit 30 sample the downconverted analog signals at each frequency band at 12-bits of resolution. Ex. 1007, 3:38-39; 3:61-64; 4:16. On the reverse path at the master unit 20, each digital combiner 432, 434, 436, 438 performs digital combining to “creat[e a] 14-bit intermediate frequency signals by combining four 12-bit intermediate frequency signals in the same frequency band.” *Id.*, 5:16-17; Ex. 1005, ¶58.

FIG. 5

Thus Oh renders obvious the first unit (20) digitally sums (at 430) the corresponding digital RF samples received from the plurality of second units (30) in order to produce the summed digital RF samples at a resolution (14 bits) greater than a resolution (12 bits) of the digital RF samples being summed. Ex. 1005, ¶¶538-539.

11. Dependent Claim 13

Claim 13 recites “the wireless radio frequency spectrum comprises a cellular radio frequency spectrum.” Oh discloses receiving and operations on base station/mobile terminal signals at 800MHz and 1800MHz. Ex. 1007, 3:19, 4:40. Those 800MHz and 1800MHz examples are both within the cellular radio frequency

spectrum. Ex. 1005, ¶¶540.

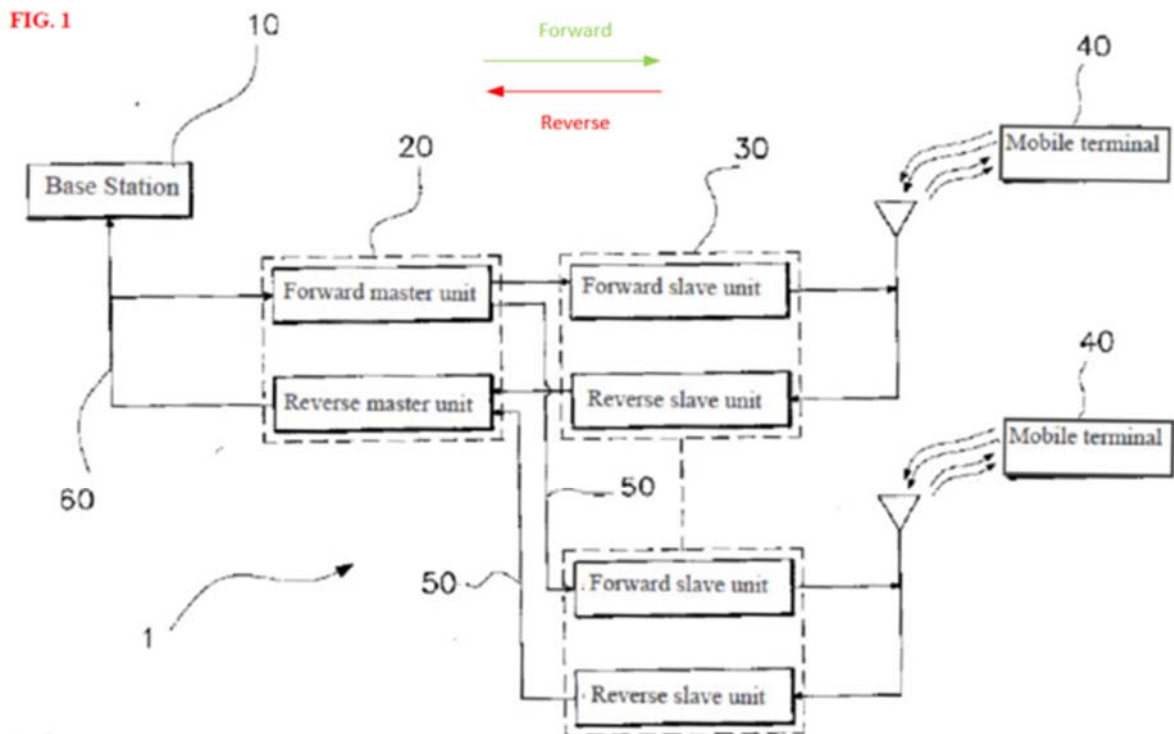

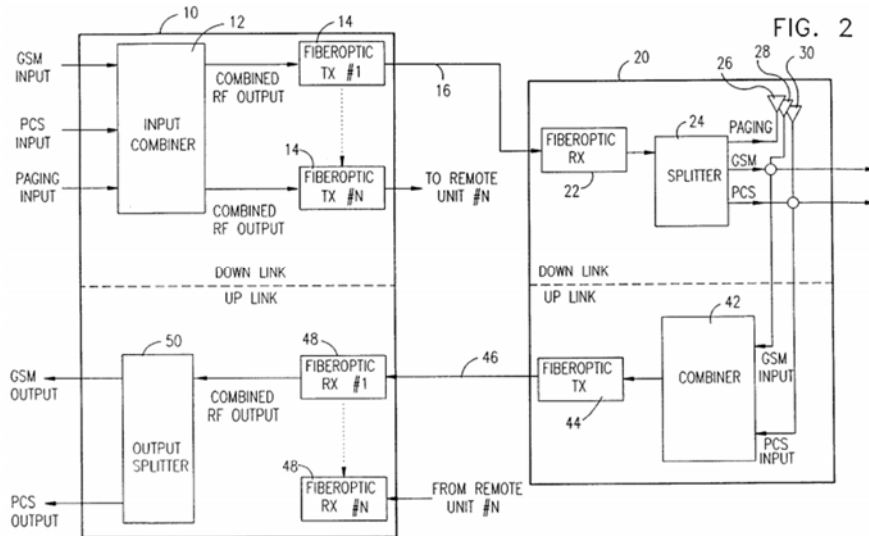

Thus Oh renders obvious the wireless radio frequency spectrum comprises a cellular radio frequency spectrum (800MHz, 1800MHz). *Id.*

12. Dependent Claim 14

Claim 14 recites “the at least one communication medium comprises at least one of: a single mode optical fiber, a multi-mode optical fiber, and a coaxial cable.”

Oh discloses that the master unit 20 communicates digital data to slave units 30 via optic lines 50. Ex. 1007, 3:4-6. Oh is agnostic as to whether multimode or single mode fiber is used. A POSITA would consider selection of multimode or single mode to be a matter of design choice. This is evidenced by Farber which describes the use of single or multimode fiber in an antenna system for reaching difficult coverage areas (*see*, Fig. 1) that is very similar to the digital system of Oh. Ex. 1022 (“Farber”), 4:30-33 (“Preferably the transmitter 14 employs a vertical cavity surface emitting laser or an edge emitting laser coupled to a single or multi-mode fiber 16.”); Fig. 2. As further evidence of obviousness of using single or multimode fiber, Haas illustrates the cost-benefit analysis of selection of multimode or single mode fiber for an application. Ex. 1012, 1125. A POSITA would have been motivated to select multimode fiber as disclosed by Haas for communicating among a host and remote units when cost is a significant factor for the project. Additionally as disclosed by Haas, in some instances multimode fiber may already be installed in an area into which an RF distribution

network is being implemented, making reuse of that multimode fiber an attractive option.

Thus a POSITA would have considered it obvious to select one of the two possible choices to implement optic lines 50, where the claim encompasses both

possible choices. Ex. 1005, ¶¶541-542.

13. Independent Claim 15

- (a) **Preamble: “A first unit for use with a coverage area in which one or more wireless units transmit in a wireless radio frequency spectrum,”**

To the extent the preamble is limiting, Oh renders the preamble obvious for the reasons provided above for the preamble of claim 1, where Oh describes a first unit (20) for use within a coverage area in which one or more wireless units 40 transmit in a wireless radio frequency spectrum (*e.g.*, 800 MHz, 1800MHz). Ex. 1005, ¶543.

- (b) **Element 1a: “an interface to communicatively couple the first unit to a plurality of second units using at least one communication medium,”**

Oh discloses master unit 20 is coupled to multiple remote slave units 30 via optic lines 50.

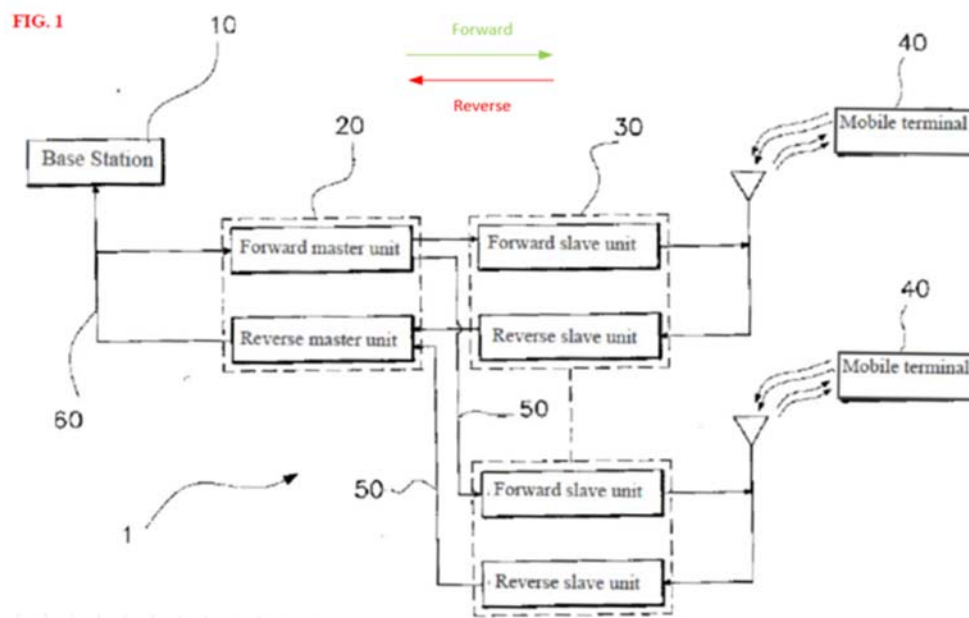

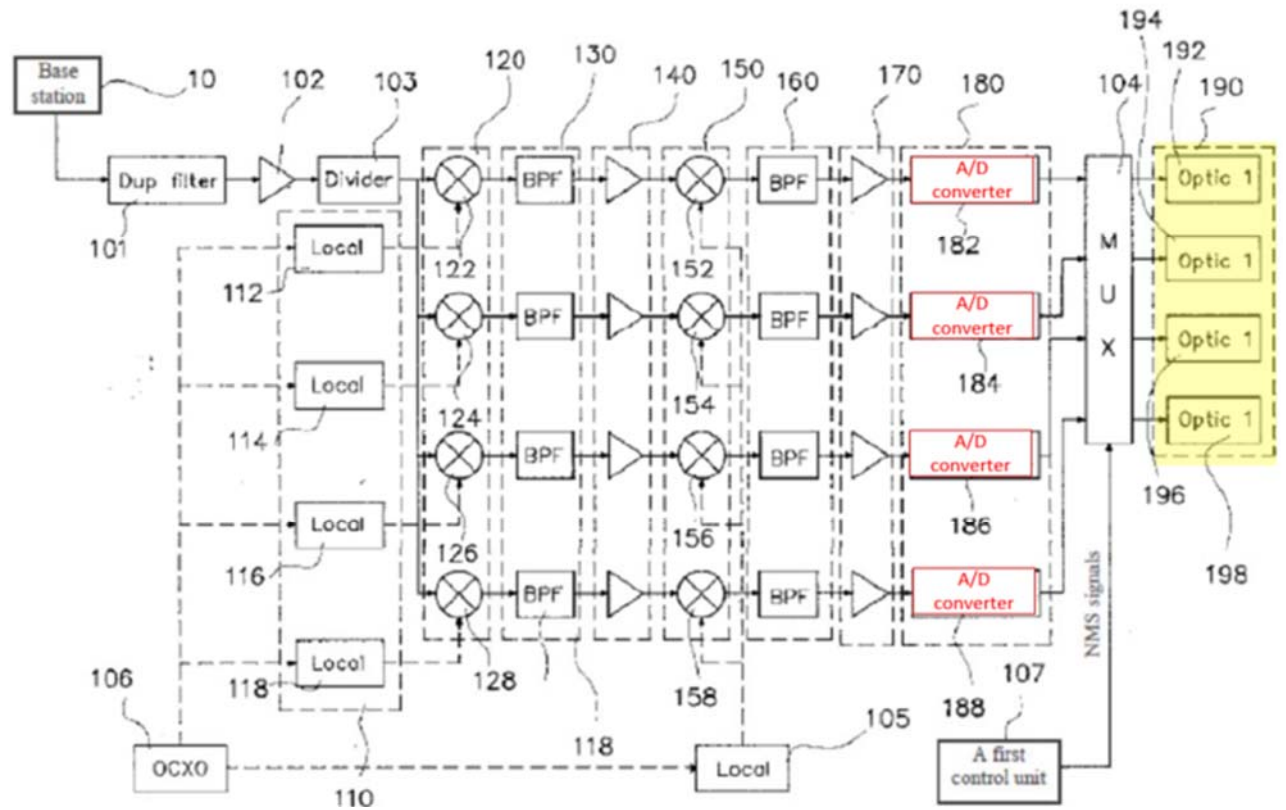

Fig. 2 of Oh depicts optic converter unit 190 that provides a downstream interface

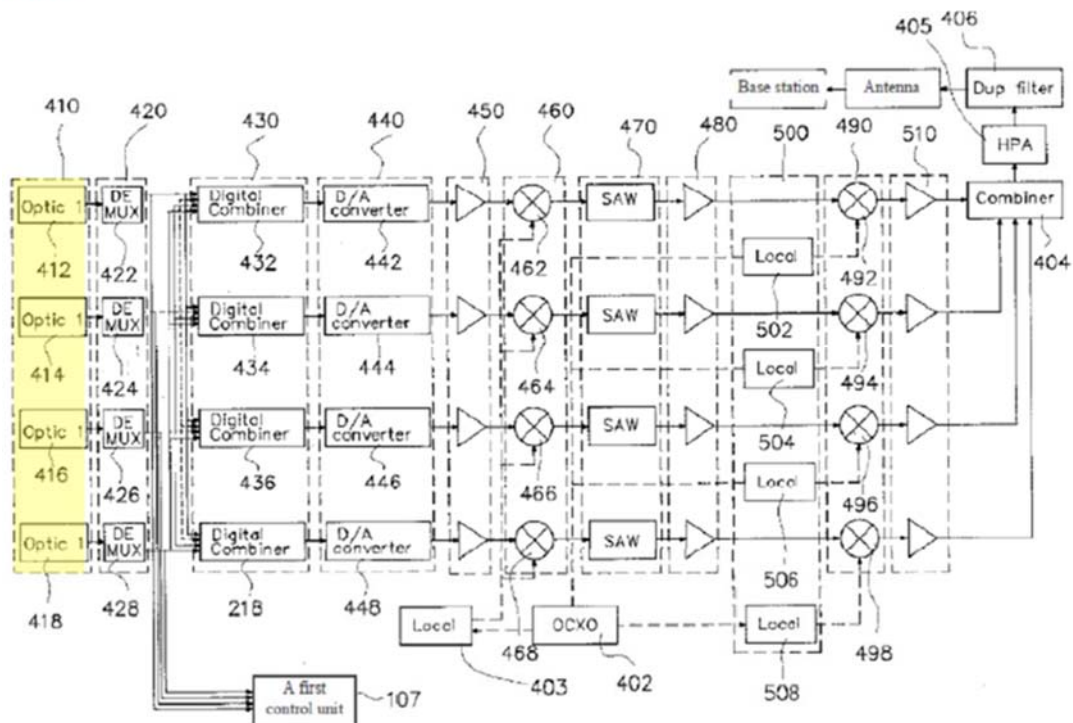

between master unit 20 and remote slave units 30.

FIG. 2

And Fig. 5 illustrates optic converter unit 410 that provides an upstream interface from slave units 30 to master unit 20.

FIG. 5

Thus Oh renders obvious an interface (190, 410) to communicatively couple the first unit (20) to a plurality of second units (30) using at least one communication medium (50). Ex. 1005, ¶¶543-545.

- (c) **Element 1b: “wherein each of the plurality of second units is associated with a portion of the coverage area and each of the plurality of second units receives a respective analog wireless signal comprising the wireless radio frequency spectrum and any transmissions from any of the wireless units that are within the portion of the coverage area associated with that second unit”**

Oh renders element 1b obvious for the reasons provided above with respect to elements 2 and 3 of claim 1. Ex. 1005, ¶546.

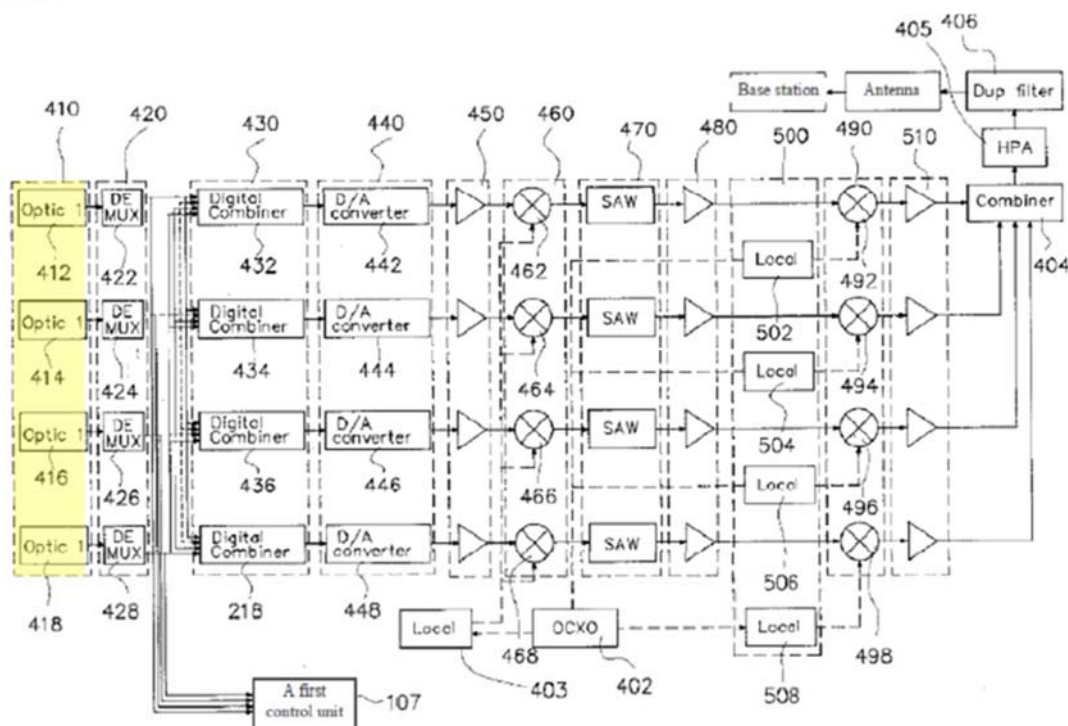

- (d) **Element 1c: “wherein each of the plurality of second units generates respective digital RF samples indicative of the respective analog wireless signal received at that second unit,”**

Oh renders element 1c obvious for the reasons provided above with respect to element 4 of claim 1. Ex. 1005, ¶547.

- (e) **Element 1d: “wherein the interface is used to receive the digital RF samples from the plurality of second units;”**

Oh Fig. 5 illustrates optic converter unit 410 that provides an upstream interface from slave units 30 to master unit 20 that receives “the serial data signals transmitted from each slave unit 30.” Ex. 1007, 4:65-67.

FIG. 5

Thus Oh renders obvious the interface (410) is used to receive the digital RF samples from the plurality of second units (30). Ex. 1005, ¶¶548-549.

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

- (f) **Element 2: “a digital summer to digitally sum corresponding digital RF samples received from the plurality of second units to produce summed digital RF samples;”**

Oh renders element 2 obvious for the reasons provided above for claim 1, element 6, where digital combiners 432, 434, 436, 438 sum digital samples received from the remote slave units 30 to produce summed digital RF samples. Ex. 1005, ¶550.

- (g) **Element 3: “wherein the first unit is configured so that an input used for base station processing is derived from the resulting summed digital RF samples.”**

Oh renders element 3 obvious for the reasons provided above for claim 1, element 7. Ex. 1005, ¶551.

14. Dependent Claims 16-17 and 19-22

Dependent claims 16-17 and 19-22 are rendered obvious by Oh for the reasons provided above for claims 3, 4, 7, 8, 12, 13, respectively. Ex. 1005, ¶552.

15. Independent Claim 23

- (a) **Preamble: “A method used with wireless radio frequency signals within a coverage area in which one or more wireless units transmit in a wireless radio frequency spectrum, the method using a first unit and a plurality of second units, each of the plurality of second units being associated with a portion of the coverage area, the method comprising:”**

To the extent the preamble is limiting, it is rendered obvious by Oh for the reasons provided above for the preamble and elements 1-2 of claim 1, where one or more wireless units (40) transmit in a wireless radio frequency spectrum, in a system

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

that includes a first unit (20) and a plurality of second units (30), each of the plurality of second units being associated with a portion of the coverage area. Ex. 1005, ¶553.

- (b) Element 1: “at each of the plurality of second units: receiving a respective analog wireless signal comprising the wireless radio frequency spectrum and any transmissions from any of the wireless units that are within the portion of the coverage area associated with that second unit;”**

Element 1 is rendered obvious by Oh for the reasons provided above for claim 1, element 3. Ex. 1005, ¶554.

- (c) Element 2: “generating respective digital RF samples indicative of the respective analog wireless signal received at that second unit;”**

Element 2 is rendered obvious by Oh for the reasons provided above for claim 1, element 4. Ex. 1005, ¶555.

- (d) Element 3: “communicating the respective digital RF samples generated by that second unit to the first unit using at least one communication medium;”**

Element 3 is rendered obvious by Oh for the reasons provided above for claim 1, element 5. Ex. 1005, ¶556.

- (e) Element 4: “at the first unit, digitally summing corresponding digital RF samples received from the plurality of second units to produce summed digital RF samples.”**

Element 4 is rendered obvious by Oh for the reasons provided above for claim 1, element 6. Ex. 1005, ¶557.

16. Dependent Claim 24

Claim 24 recites “performing base station processing using an input derived from the resulting summed digital RF samples.” Oh renders this limitation obvious for the reasons provided above for claim 1, element 7. Ex. 1005, ¶558.

17. Dependent Claims 25-31

Dependent claims 25-31 are rendered obvious by Oh for the reasons provide above for claims 3, 4, 8, 12, 13, 10, and 11, respectively. Ex. 1005, ¶559.

18. Independent Claim 32

(a) Preamble and Elements 1-6

Oh renders the preamble and elements 1-6 of claim 32 obvious for the reasons provided above for the preamble and elements 1-6 of claim 1. Ex. 1005, ¶560.

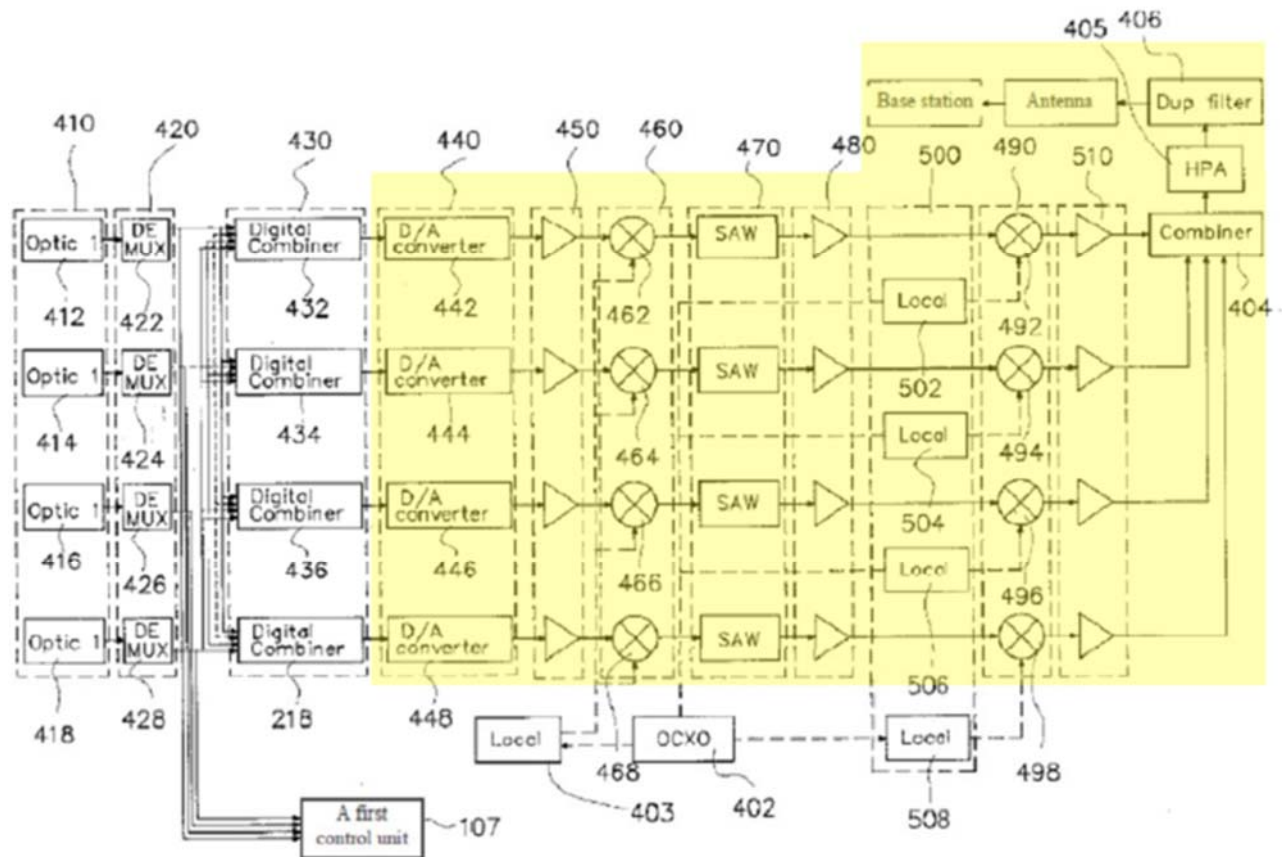

(b) Element 7: “wherein the system is configured so that an input used for wireless protocol processing is derived from the resulting summed digital RF samples”

The term “wireless protocol processing” is not used in the '286 patent specification. A POSITA would understand “wireless protocol processing” to mean processing signals in preparation/transmission of those processed signals according to a wireless protocol.

Oh renders that limitation obvious. Following the digital summing operation referenced above in addressing element 6, the summed digital data values in Oh are converted to analog signals, up converted to the appropriate frequency signals associated with their particular bands to create component analog signals, that are then

combined and wirelessly transmitted to a base station via an antenna.

FIG. 5

Specifically Oh states:

After creating 14-bit intermediate frequency signals by combining four 12-bit intermediate frequency signals in the same frequency band, said digital combiner transmits them to a first D/A converter unit 440. Each D/A converter 442, 444, 446, and 448 of said first D/A converter unit 440 converts 14-bit digital signals to the intermediate [frequency] signals, analog signals; and transmits 1.23MHz or 1.5MHz intermediate frequency signals to each mixer 462, 464, 466, and 468 of a third mixer unit 460 through a third amplification unit 450. Said third mixer unit 460 outputs 70MHz intermediate frequency signals by mixing 1.23MHz or

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

1.5MHz intermediate frequency signals transmitted from a first D/A converter unit 440 with 68.77MHz or 68.5MHz oscillating frequency transmitted from a third local unit 403. The intermediate frequency signals outputted from said third mixer unit 460 are transmitted to a fourth mixer unit 490 through a first saw filter unit 470 and a fourth amplification unit 480. Said fourth mixer unit 490 mixes the oscillating frequency in different frequency bands transmitted from a fourth local unit 500 with 70MHz intermediate frequency signals; and transmits 800MHz RF signals in different frequency bands to a first combiner 404 through a fifth amplification unit 510.

Ex. 1007, 5:16-26. The analog signals are combined at 404 (*i.e.*, analog combining) to “aggregate[] the RF signals in different frequency bands transmitted from four mixers 492, 494, 496, and 498,” and are amplified at 510 and run through a bi-directional filter 406 to an antenna and a base station.

Thus Oh renders obvious the system being configured so that an input used for wireless protocol processing is derived from the resulting summed digital RF samples (the output of 430 is used as an input to circuitry at 440, 450, 460, 470, 480, 490, 520, 404, 405, 406 in preparation for wireless transmission to the base station). Ex. 1005, ¶¶561-563.

19. Dependent Claims 33-34

Dependent claims 33 and 34 are rendered obvious by Oh for the reasons provided above for claims 3 and 4. Ex. 1005, ¶564.

20. Independent Claim 37

(a) Preamble and Elements 1 and 2

The preamble and elements 1 and 2 are rendered obvious by Oh for the reasons provided above for the preamble and elements 1 and 2 of claim 15 above. Ex. 1005, ¶565.

(b) Element 3: “the first unit is configured so that an input used for wireless protocol processing is derived from the resulting summed digital RF samples”

Element 3 of claim 37 is rendered obvious by Oh for the reasons provided above for element 7 of claim 32. Ex. 1005, ¶566.

21. Dependent Claims 38-39

Dependent claims 38 and 39 are rendered obvious by Oh for the reasons provided above for claims 3 and 4. Ex. 1005, ¶567.

C. Ground 1b: Claims 5-6, 18, 35-36, and 40 Are Obvious Over Oh in view of Allpress

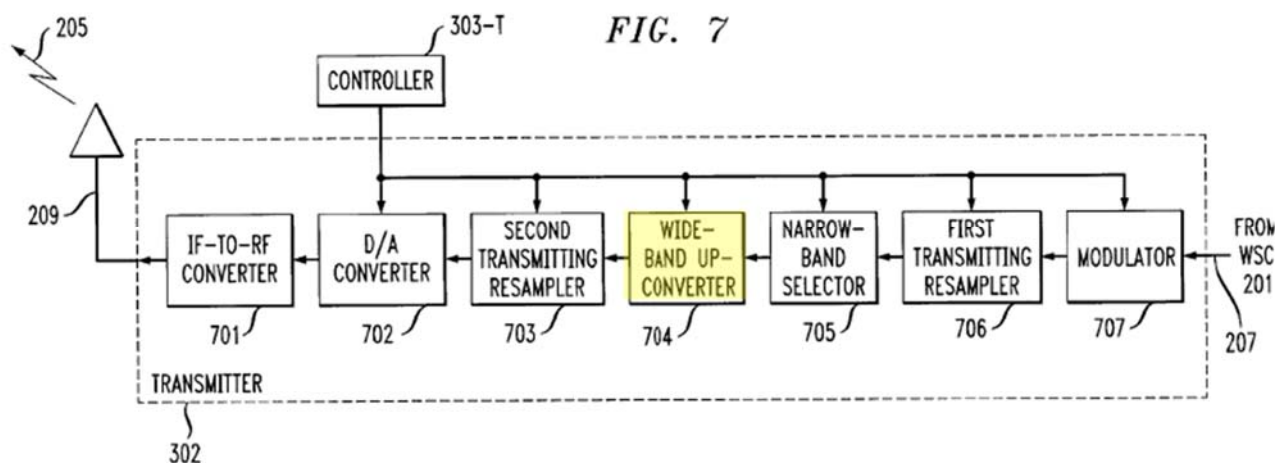

1. Motivation to Combine

A POSITA would be motivated to combine the teachings of Allpress with Oh for a variety of reasons. As noted in Allpress, implementation of software transceivers can offer a cost and complexity advantage over hardware implementations by avoiding the need for “duplicative hardware” that has associated expense and maintenance costs. Further, software transceivers are more portable to different systems, using different communications protocols, where software transceiver

behavior can be modified through adjustment of software settings as opposed to replacement of physical hardware components. Thus a software transceiver is not “standards specific” and can be easily configured to the requirements of a current use case. Ex. 1005, ¶568.

2. Dependent Claim 5

Claim 5 recites “the system further comprises software configured to perform the base station processing using the input derived from the resulting summed digital RF samples.” While Oh depicts a hardware implementation of its reverse master unit that performs “base station processing,” a POSITA would consider implementation of some or all of Oh’s post-summing (430) processing in software, where Allpress discloses a transmitter in Fig. 7 that provides upconversion 704 and other functions analogous to Oh’s base station processing in software. Ex. 1020, 8:40-43.

Thus Oh in view of Allpress renders obvious the system further comprises software (*e.g.*, software upconversion and other functionality as disclosed in Allpress)

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

configured to perform the base station processing using the input derived from the resulting summed digital RF samples (outputs of Oh 430). Ex. 1005, ¶¶569-570.

3. Dependent Claim 6

Claim 6 recites “the first unit comprises the software configured to perform the base station processing using the input derived from the resulting summed digital RF samples.” As discussed above, Oh in view of Allpress renders obvious using software to perform certain of Oh’s reverse master unit functionality depicted in Fig. 5. A POSITA would consider it obvious to implement that software functionality in Oh’s master unit 20 (*i.e.*, the same location as Oh’s hardware implementation).

Thus Oh in view of Allpress renders obvious the first unit (Oh, 20) comprises the software configured to perform the base station processing using the input derived from the resulting summed digital RF samples. Ex. 1005, ¶¶571-572.

4. Dependent Claim 18, 35, 36, and 40

Dependent claim 35 is rendered obvious by Oh in view of Allpress for the reasons provided above for claim 5.

Dependent claims 18, 36, and 40 are rendered obvious by Oh in view of Allpress for the reasons provided above for claim 6. Ex. 1005, ¶573.

VI. Mandatory Notices Pursuant to 37 C.F.R. § 42.8(a)(1)

Pursuant to 37 C.F.R. § 42.8(a)(1), the mandatory notices identified in 37 C.F.R. § 42.8(b) are provided below as part of this petition.

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

A. 37 C.F.R. § 42.8(b)(1): Real Parties-In-Interest

SOLiD, Inc., SOLiD Gear, Inc., SOLiD Technologies, Inc., and SOLiD Gear Pte, Ltd. are the real parties-in-interest for Petitioner.

B. 37 C.F.R. § 42.8(b)(2): Related Matters

The '286 patent was the subject of litigation in *CommScope Technologies LLC v. SOLiD Gear, Inc. et al.*, No. 3-20-cv-01285 (N.D. Tx.), filed on May 18, 2020. That litigation was dismissed without prejudice on January 6, 2021. IPR petitions for the remaining asserted patents of this litigation are being filed concurrently herewith.

The '286 patent is also currently the subject of litigation in *CommScope Technologies LLC v. Dali Wireless Inc.*, No. 3-16-cv-00477 (N.D. Tx.), filed on February 1, 2016, now on appeal to the Federal Circuit in *CommScope Technologies LLC v. Dali Wireless Inc.*, 20-1817; -1818. Petitioner is uninvolved in that litigation.

CommScope Technologies LLC v SOLiD Technologies, Inc. High Court of Justice (Patents Court), Business and Property Courts of England & Wales, Claim number HP-2020-000017, is a further litigation involving the parties here.

C. 37 C.F.R. § 42.8(b)(3), (4): Lead And Back-Up Counsel And Service Information

Petitioner provides the following designation of counsel:

Lead Counsel	Back-up Counsel
Matthew W. Johnson (Reg. No. 59,108) JONES DAY 500 Grant Street, Suite 4500 Pittsburgh, PA 15219-2514	S. Christian Platt (Reg. No. 46,998) JONES DAY 4655 Executive Drive, Suite 1500 San Diego, CA 92121-3134

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

(412) 394-9524 mwjohnson@jonesday.com	(858) 314-1556 cplatt@jonesday.com Stephanie M. Mishaga (Reg. No. 75,378) JONES DAY 4655 Executive Drive, Suite 1500 San Diego, CA 92121-3134 (858) 703-3140 smishaga@jonesday.com Yeah-Sil Moon (Reg. No. 52,042) JONES DAY 250 Vesey Street New York, NY 10281-1047 (212) 326-3778 ymoon@jonesday.com David B. Cochran (Reg. No. 39,142) JONES DAY 901 Lakeside Ave. Cleveland, OH 44114 (216) 586-7029 dcochran@jonesday.com
--	---

Pursuant to 37 C.F.R. § 42.10(b), a Power of Attorney accompanies this petition. Please address all correspondence to lead and back-up counsel at the addresses above. Petitioner also consents to electronic service by email at the email addresses listed above.

VII. Conclusion

Petitioner therefore requests that the Patent Office order an IPR trial and then proceed to cancel claims 1-40.

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

Dated: August 12, 2021

Respectfully submitted,

/s/ Matthew W. Johnson

PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NO. 8,577,286

CERTIFICATE OF SERVICE

The undersigned hereby certifies that a copy of the foregoing petition for *Inter Partes* Review of U.S. Patent No. 8,577,286, including all Exhibits, was served on August 12, 2021 via Express Mail delivery directed to the attorney of record for the patent at the following address:

FOGG & POWERS LLC
4600 W 77th Street
Suite 305
MINNEAPOLIS MN 55435

Additionally, a courtesy copy of the foregoing petition for *Inter Partes* Review of U.S. Patent No. 8,577,286, and the accompanying Declaration of Dr. R. Jacob Baker, was sent on August 12, 2021 to CommScope's litigation counsel via email to the following addresses:

dsheehan@dsa-law.com
pcaspers@carlsoncaspers.com
shamer@carlsoncaspers.com
imcintyre@carlsoncaspers.com
